# COMP5347 Web Application Development

Week 9.  
Introduction to React Framework  
(Guest Lecture)

Presented by Hunter (Hang) Xu  
School of Computer Science

Last updated: April 18, 2023

# Agenda

THE UNIVERSITY OF  
**SYDNEY**

Faculty of Engineering  
School of Computer Science

Experience of UI/CSS Framework

The basic ideas behind front-end framework

Build your own front-end framework?

Main concepts of React.js

Notice:

Here the front-end framework only refers to those frameworks and libraries that made for JavaScript, although in a broader view the front-end framework always involves HTML, CSS and JavaScript together. CSS framework and UI framework are used interchangeably to refer to those framework (or library) that decorate and bundle HTML elements using various HTML element and CSS style combinations.

In short:

- Front-end framework works for JavaScript mainly
- UI/CSS framework works for CSS mainly
- They all involve HTML element (it is the cornerstone)
- Framework and Library are used interchangeably in these contexts.

THE UNIVERSITY OF  
SYDNEY

Faculty of Engineering  
School of Computer Science

Part 1.

# CSS/UI Framework

Before we dive into front-end framework,  
we first take a look at CSS frameworks...

- Bulma
- Bootstrap
- Tailwind

# Tastes of UI/CSS Framework

THE UNIVERSITY OF  
SYDNEY

Faculty of Engineering  
School of Computer Science

## Bulma (beginner-friendly)

White    Light    Dark    Black    Text    Ghost

```
<button class="button is-white">White</button>
<button class="button is-light">Light</button>
<button class="button is-dark">Dark</button>
<button class="button is-black">Black</button>
<button class="button is-text">Text</button>
<button class="button is-ghost">Ghost</button>
```

## Bootstrap (made by Twitter)

Primary    Secondary    Success    Danger    Warning  
Info    Light    Dark    Link

```
<button type="button" class="btn btn-primary">Primary</button>
<button type="button" class="btn btn-secondary">Secondary</button>
<button type="button" class="btn btn-success">Success</button>
<button type="button" class="btn btn-danger">Danger</button>
<button type="button" class="btn btn-warning">Warning</button>
<button type="button" class="btn btn-link">Link</button>
```

## TailwindCSS

Button    Button    Button    Download

```
<button class="bg-blue-500 hover:bg-blue-700 text-white font-bold py-2 px-4 rounded">
  Button
</button>
```

# Experience of UI/CSS Framework

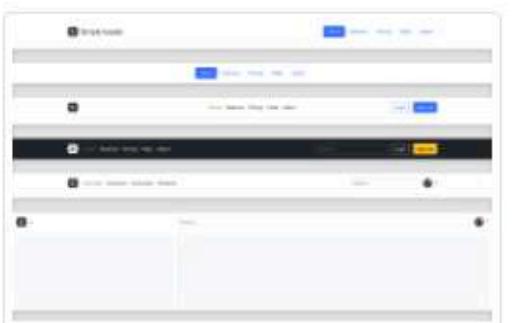

THE UNIVERSITY OF  
SYDNEY

Faculty of Engineering  
School of Computer Science

## Bootstrap

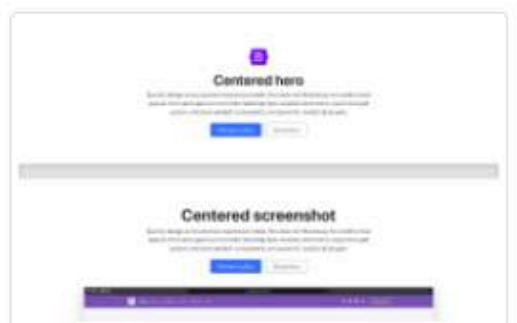

### Snippets

Common patterns for building sites and apps that build on existing components and utilities with custom CSS and more.

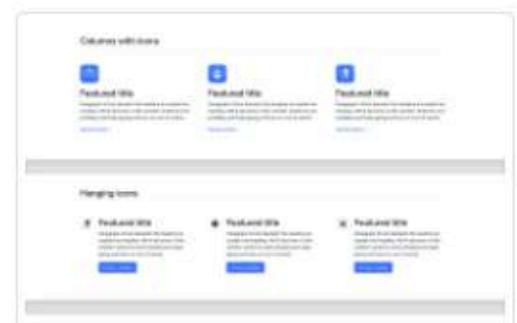

#### Headers

Display your branding, navigation, search, and more with these header components

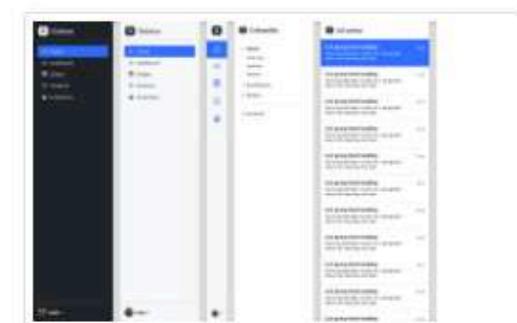

#### Heroes

Set the stage on your homepage with heroes that feature clear calls to action.

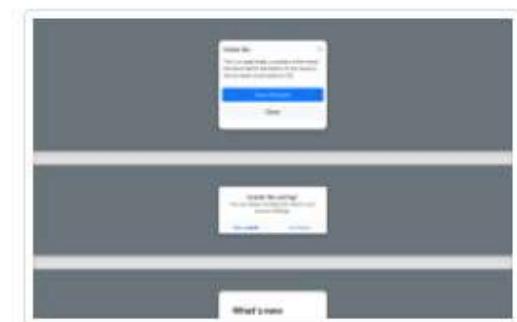

#### Features

Explain the features, benefits, or other details in your marketing content.

#### Sidebars

Common navigation patterns ideal for offcanvases or multi-column layouts.

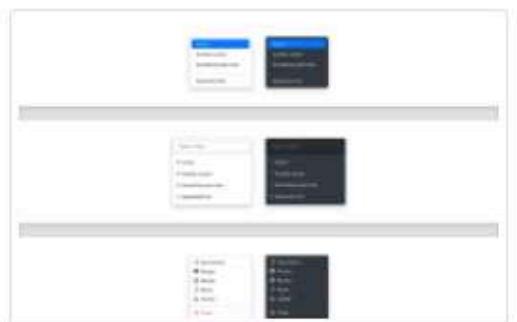

#### Footers

Finish every page strong with an awesome footer, big or small.

#### Dropdowns

Enhance your dropdowns with filters, icons, custom styles, and more.

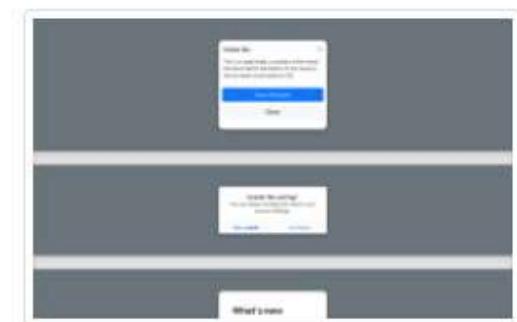

#### List groups

Extend list groups with utilities and custom styles for any content.

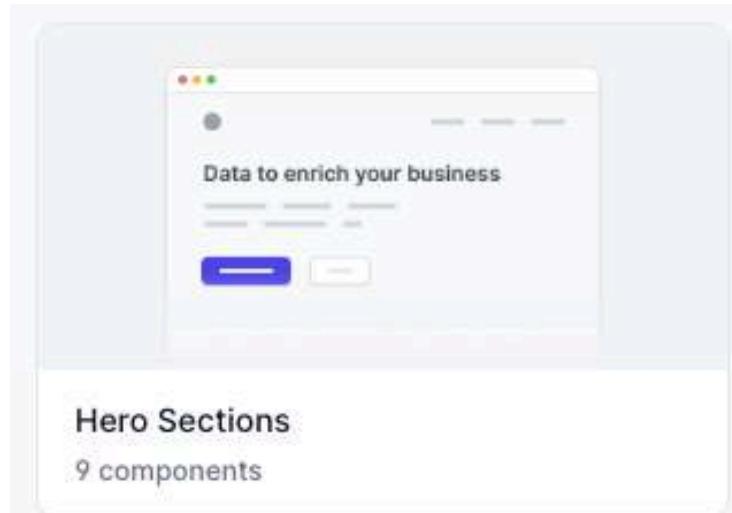

#### Modals

Transform modals to serve any purpose, from feature tours to dialogs.

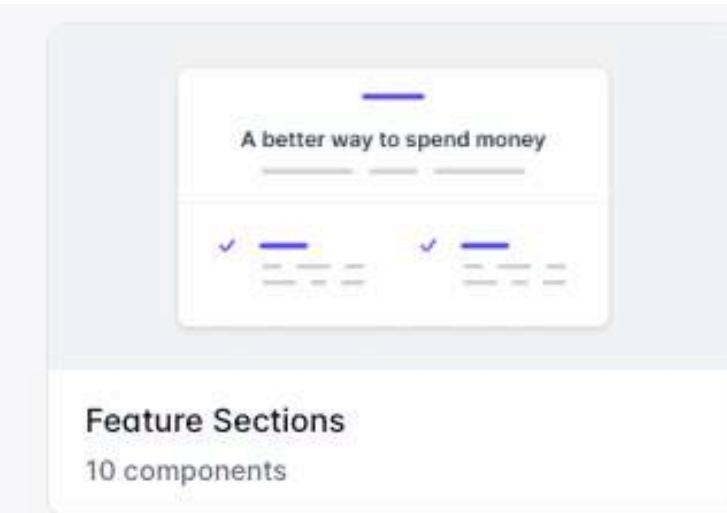

Now you know, the framework bundles fragile into components to “save your life” (make things easier, increase reusability and readability, etc.)...

## TailwindCSS

# What does front-end framework do

THE UNIVERSITY OF  
SYDNEY

Faculty of Engineering  
School of Computer Science

What can you do with React.js?

## Declarative

React makes it painless to create interactive UIs. Design simple views for each state in your application, and React will efficiently update and render just the right components when your data changes.

Declarative views make your code more predictable and easier to debug.

## Component-Based

Build encapsulated components that manage their own state, then compose them to make complex UIs.

Since component logic is written in JavaScript instead of templates, you can easily pass rich data through your app and keep state out of the DOM.

## Learn Once, Write Anywhere

We don't make assumptions about the rest of your technology stack, so you can develop new features in React without rewriting existing code.

React can also render on the server using Node and power mobile apps using [React Native](#).

What can you do with Vue.js?

# The Progressive JavaScript Framework

An approachable, performant and versatile framework for building web user interfaces.

Why Vue

Get Started →

Install

Special Sponsor

Advanced IDE for Vue

## Approachable

Builds on top of standard HTML, CSS and JavaScript with intuitive API and world-class documentation.

## Performant

Truly reactive, compiler-optimized rendering system that rarely requires manual optimization.

## Versatile

A rich, incrementally adoptable ecosystem that scales between a library and a full-featured framework.

# What does front-end framework do

Updated 2023 April

THE UNIVERSITY OF  
SYDNEY

Faculty of Engineering  
School of Computer Science

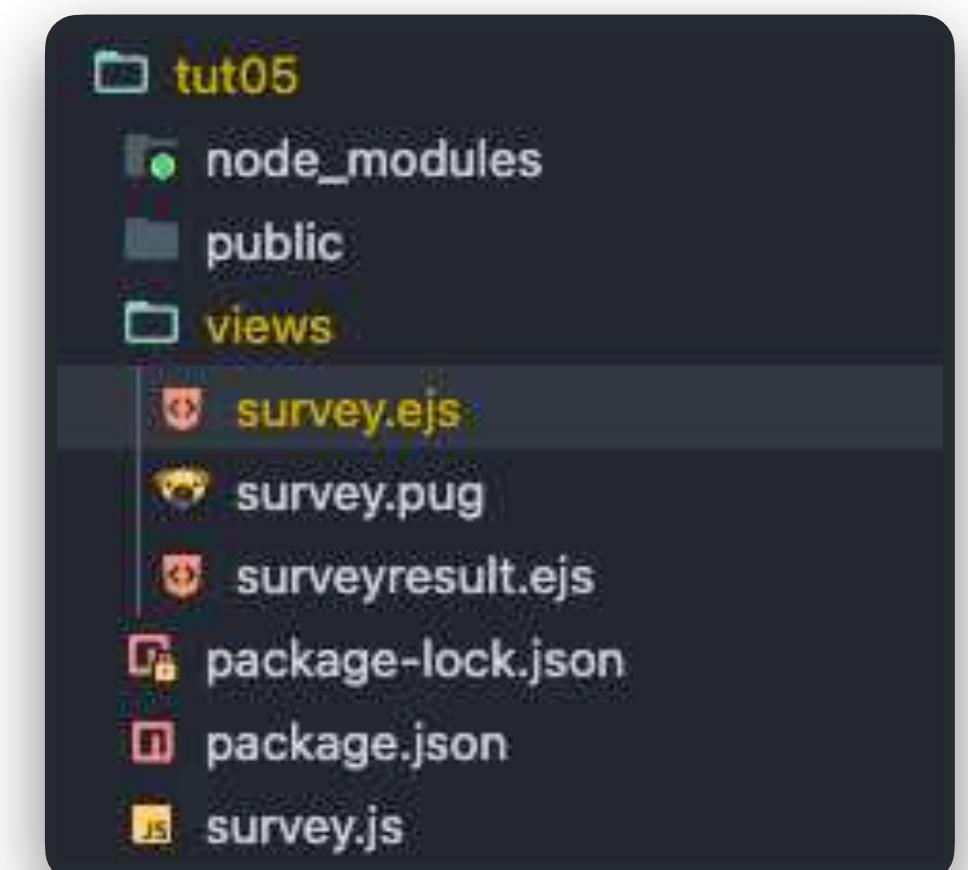

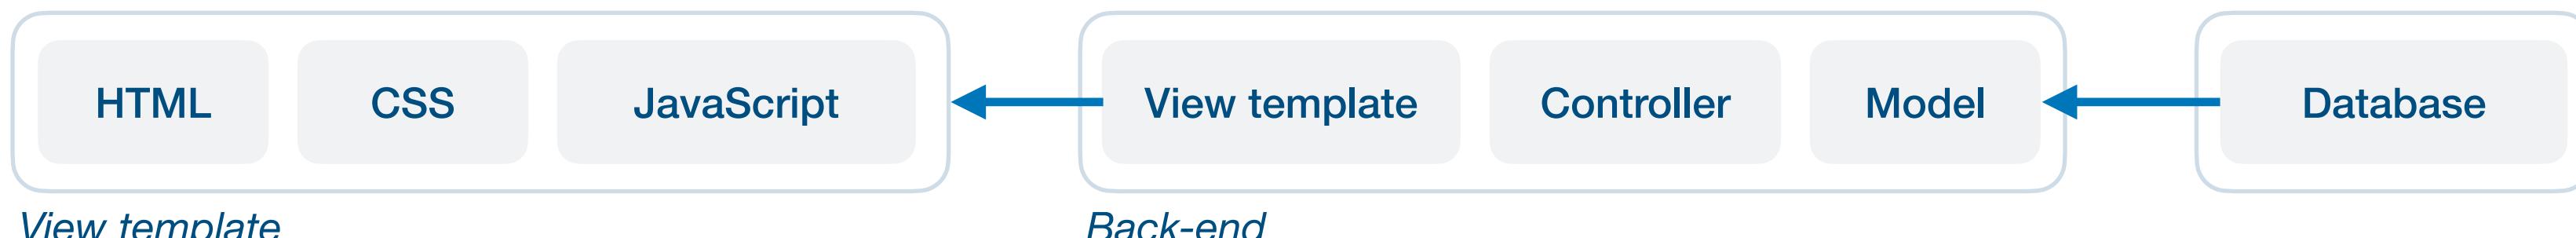

## From functionality perspective

- Serve static files
- Make API calls
- Enhance the Event Listener
- Component-based architecture:
  - Increase interactivity for HTML elements (e.g. State Management)
    - Redux for React.js
    - Vuex for Vue.js
  - Package with frequently used tools and utilities such as bundling, minification, and code optimization.
  - Associate with more handy debugging tools

## From engineering perspective

- Automated code bundling and construction → Webpack
- Syntax translation → Babel
- Extension → Third-party libraries management: npm, pip
- Integrated testing
- Increased reusability, flexibility, and scalability
- Optimized performance
- Organized code and data to make code more reusable

Think about the Node.js project in your tutorial...

If you are a little bit confused about what I am talking about... Updated 2023 April

Think from Node.js view template engine perspective, how to separate it from server side?

A screenshot of a file explorer window showing a project structure. The root folder is 'tut05'. Inside 'tut05' are 'node\_modules', 'public', and 'views' folders. The 'views' folder contains three files: 'survey.ejs', 'survey.pug', and 'surveyresult.ejs'. Additionally, there are 'package-lock.json', 'package.json', and 'survey.js' files at the root level.

```
tut05
  node_modules
  public
  views
    survey.ejs
    survey.pug
    surveyresult.ejs
  package-lock.json
  package.json
  survey.js
```

- Input Validation → from the front-end client
- Dynamically update DOMs based on the returned result of specific functions → View template & Virtual DOM & State Management
- Call back-end functions from front-end client → API
- Get/send data from/to the back-end server

A screenshot of a code editor showing the content of 'survey.ejs'. The code is a Node.js view template using EJS syntax. It includes an 

#### tag, a for loop to iterate over 'products', and individual label and input elements for each product. ``` tut05/survey.ejs <h4>What would be your next mobile?</h4> <% for (var i = 0; i<products.length;i++){%> <label> <input type="radio" name="vote" value= <%= i%> /> <%= products[i]%> </label> <br /> <% } %> ```

**It is time to pick up a front-end framework  
and learn it**

*But wait...*

# Are you going to learn all of them?

THE UNIVERSITY OF  
SYDNEY

10 Most Popular Web Frameworks 2022 - Make An App Like

- Do they share common ideas?
- What's the scene behind these frameworks?
- If I learned one framework, how can I apply to others?

## Transferrable skills!

THE UNIVERSITY OF  
SYDNEY

Faculty of Engineering  
School of Computer Science

Part 3.

## Build your own front-end framework?

- I am not here to dictate what framework you should use and why, but to explain the fundamental concepts and basic ideas behind the front-end framework. By understanding these concepts, you may even be able to create your own framework, and you will know what to look for and what to learn when you want to explore a new framework.
- In this manner, you can get started with any front-end framework within 3 days!
  - You already know the logic and motivation of a front-end framework
  - You only need to get familiar with its syntaxes, features, and coding styles, etc.

# You CAN build your own framework!

At least, you should have the confidence to learn whatever framework, you should know how it is made.

# Three cornerstones of the front-end framework

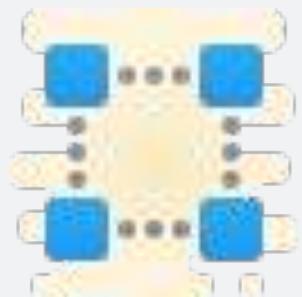

THE UNIVERSITY OF  
SYDNEY

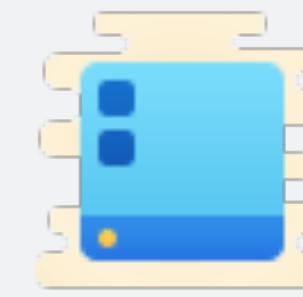

Faculty of Engineering  
School of Computer Science

Template

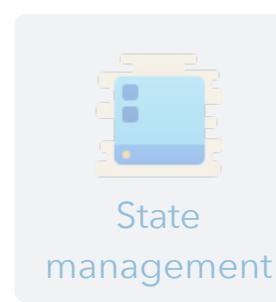

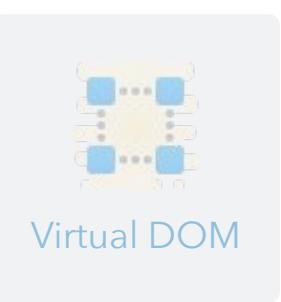

Virtual DOM

State management

# Template

THE UNIVERSITY OF  
**SYDNEY**

Faculty of Engineering  
School of Computer Science

Template engine (or view), you are already familiar with

```
tut05
  node_modules
  public
  views
    survey.ejs
    survey.pug
    surveyresult.ejs
  package-lock.json
  package.json
  survey.js
```

## Node.js template engines

- Pug
- EJS
- Handlebars
- Nunjucks
- doT
- Mustache
- Underscore
- Marko

```
tut05/survey.ejs

<h4>What would be your next mobile?</h4>
<% for (var i = 0; i<products.length;i++){%>
  <label>
    <input type="radio" name="vote" value= <%= i%> />
    <%= products[i]%>
  </label> <br />
<% } %>
```

## Template in Vuejs

```
<template>
  <span>Hello {{firstname}} {{lastName}}</span>
</template>
```

## Template in Angular

It's the same syntax as Vuejs

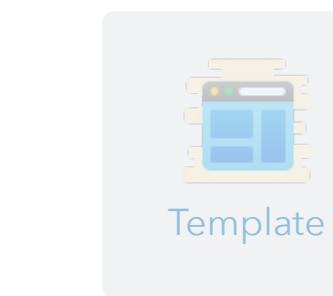

```
<template>
  <span>Hello {{firstname}} {{lastName}}</span>
</template>
```

## Template in React

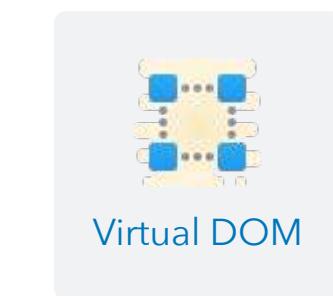

Templating in React is made using an extension of Javascript called [JSX](#) to display information.

```
const Component = ({ firstName, lastName }) => (
  <span>
    Hello {firstName} {lastName}
  </span>
);
```

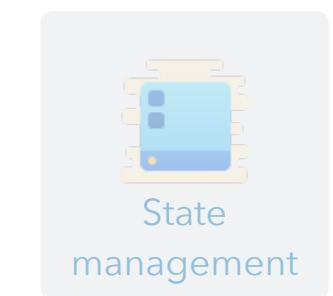

# Virtual DOM

Template

Virtual DOM

State  
management

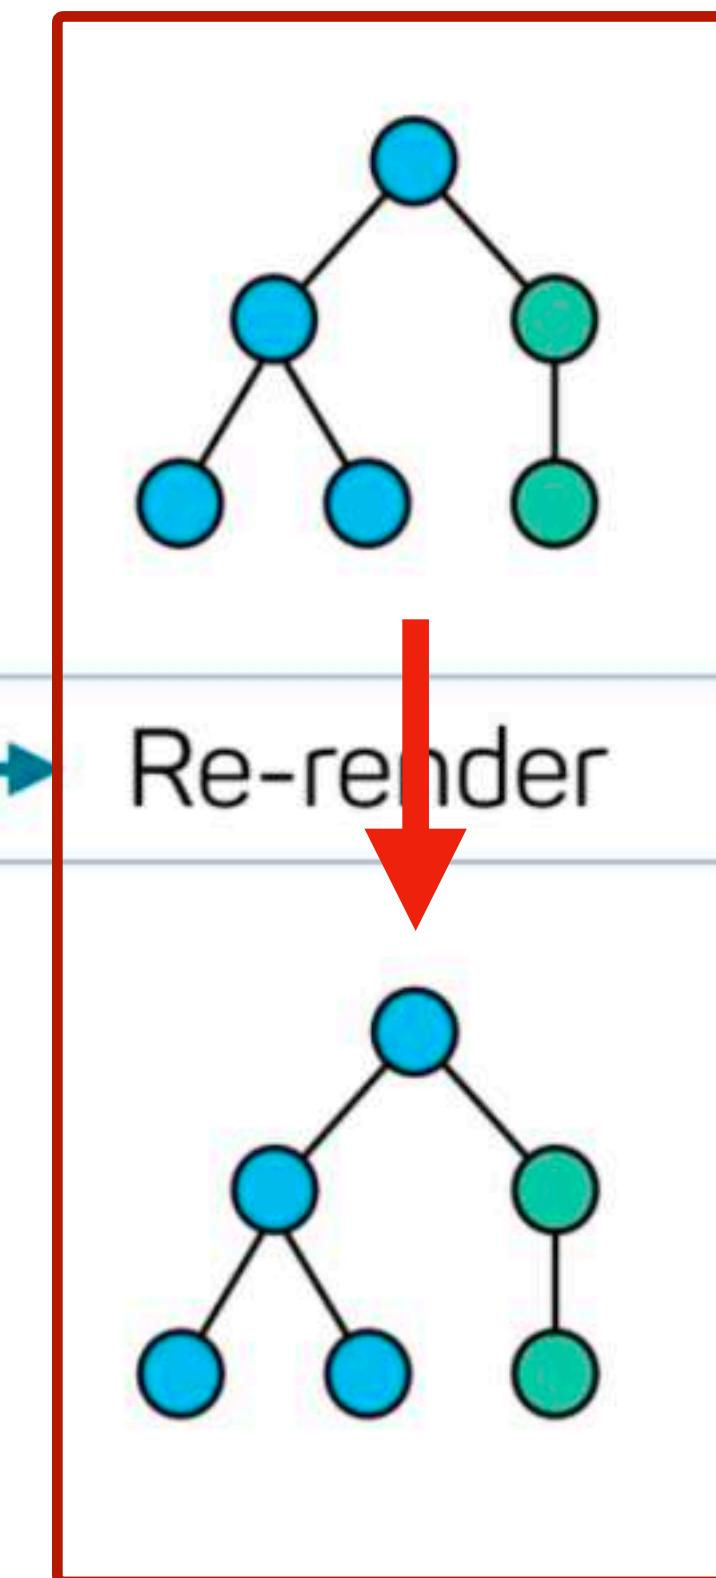

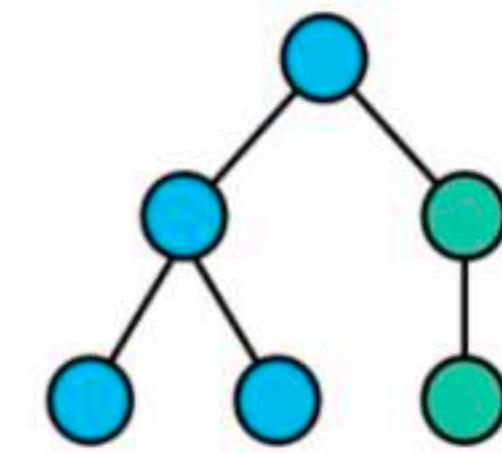

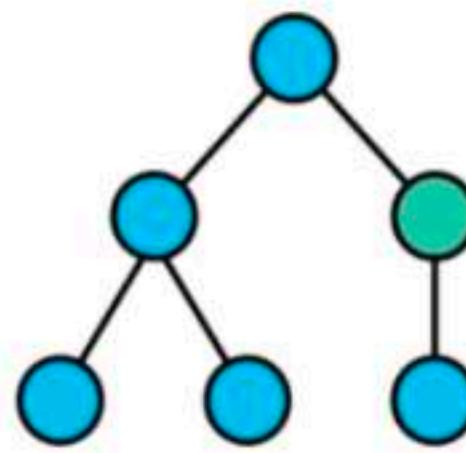

THE UNIVERSITY OF  
**SYDNEY**

Faculty of Engineering  
School of Computer Science

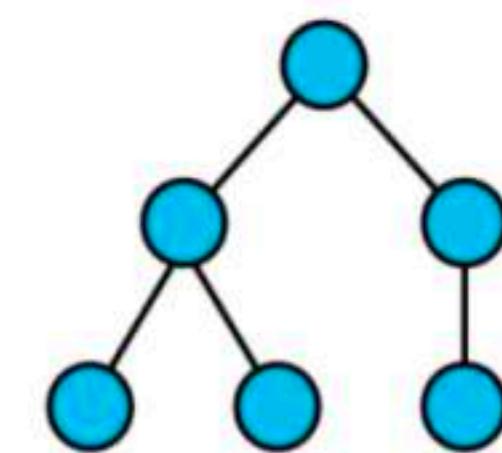

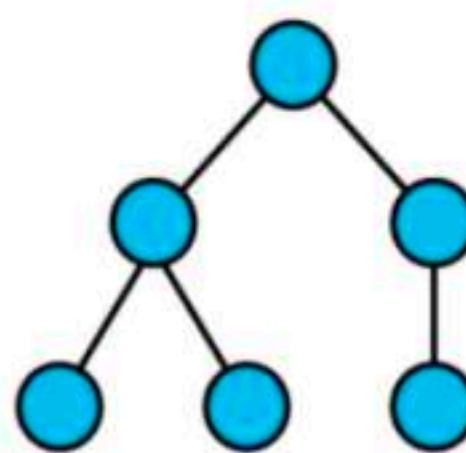

Instead of manipulating real DOM (too slow), virtual DOM is used to handle event

## Virtual Dom

State change → Compute Diff

→ Re-render

## Browser Dom

### React.js

- Use a fork of [snabbdom](#) (open-source)

### Vue.js

- Self-developed and internally maintained

### Angular

- Sorry, Angular manipulates the [REAL DOM!](#)

# State Management

Template

Virtual DOM

State management

THE UNIVERSITY OF  
**SYDNEY**Faculty of Engineering  
School of Computer Science

State are variables inside the component, it is different/special because it lies in presentation layer (view), where the DOM need to be updated immediately when the state is updated/changed.

## State in React

```
// initial state
this.state = { firstName: "Marvin" };

// modifying the state
this.setState({ firstName: "Thomas" });
```

## State in Vue.js

```
const component = new View({
  data() {
    // initial state
    return { firstName: "Marvin" };
  },
  methods: {
    changeName() {
      // modifying the state
      this.firstName = "Thomas";
    }
  }
});
```

## State in Angular

```
// initial state
this.firstName = "Marvin";

// modifying the state
handleClick() {
  this.firstName = "Thomas";
}
```

## State management system (library)

### In React.js

- Hooks
- Redux

### In Vue.js

- Vuex

### In Angular

- NgRx (inspired by Redux)

# Three cornerstones of the front-end framework

Components

Template

Virtual DOM

State management

# Component

*It is the main entity in a framework*

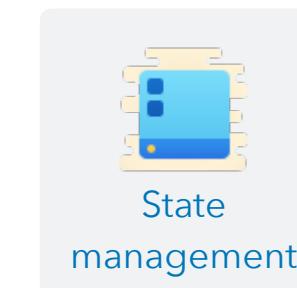

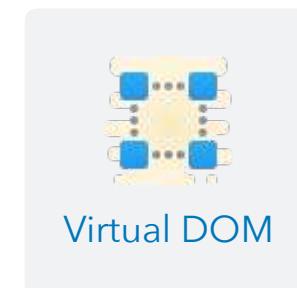

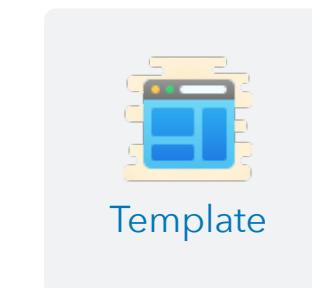

## Vue.js

### Defining a Component

When using a build step, we typically define each Vue component in a dedicated file using the `.vue` extension - known as a **Single-File Component** (SFC for short):

```
<script>
export default {
  data() {
    return {
      count: 0
    }
  }
}
</script>

<template>
  <button @click="count++">You clicked me {{ count }} times.</button>
</template>
```

THE UNIVERSITY OF  
SYDNEY

Faculty of Engineering  
School of Computer Science

## React.js

### A Simple Component

React components implement a `render()` method that takes input data and returns what to display. This example uses an XML-like syntax called JSX. Input data that is passed into the component can be accessed by `render()` via `this.props`.

**JSX is optional and not required to use React.** Try the [Babel REPL](#) to see the raw JavaScript code produced by the JSX compilation step.

LIVE JSX EDITOR  JSX?

```
class HelloMessage extends React.Component {
  render() {
    return <div>Hello {this.props.name}</div>;
  }
}

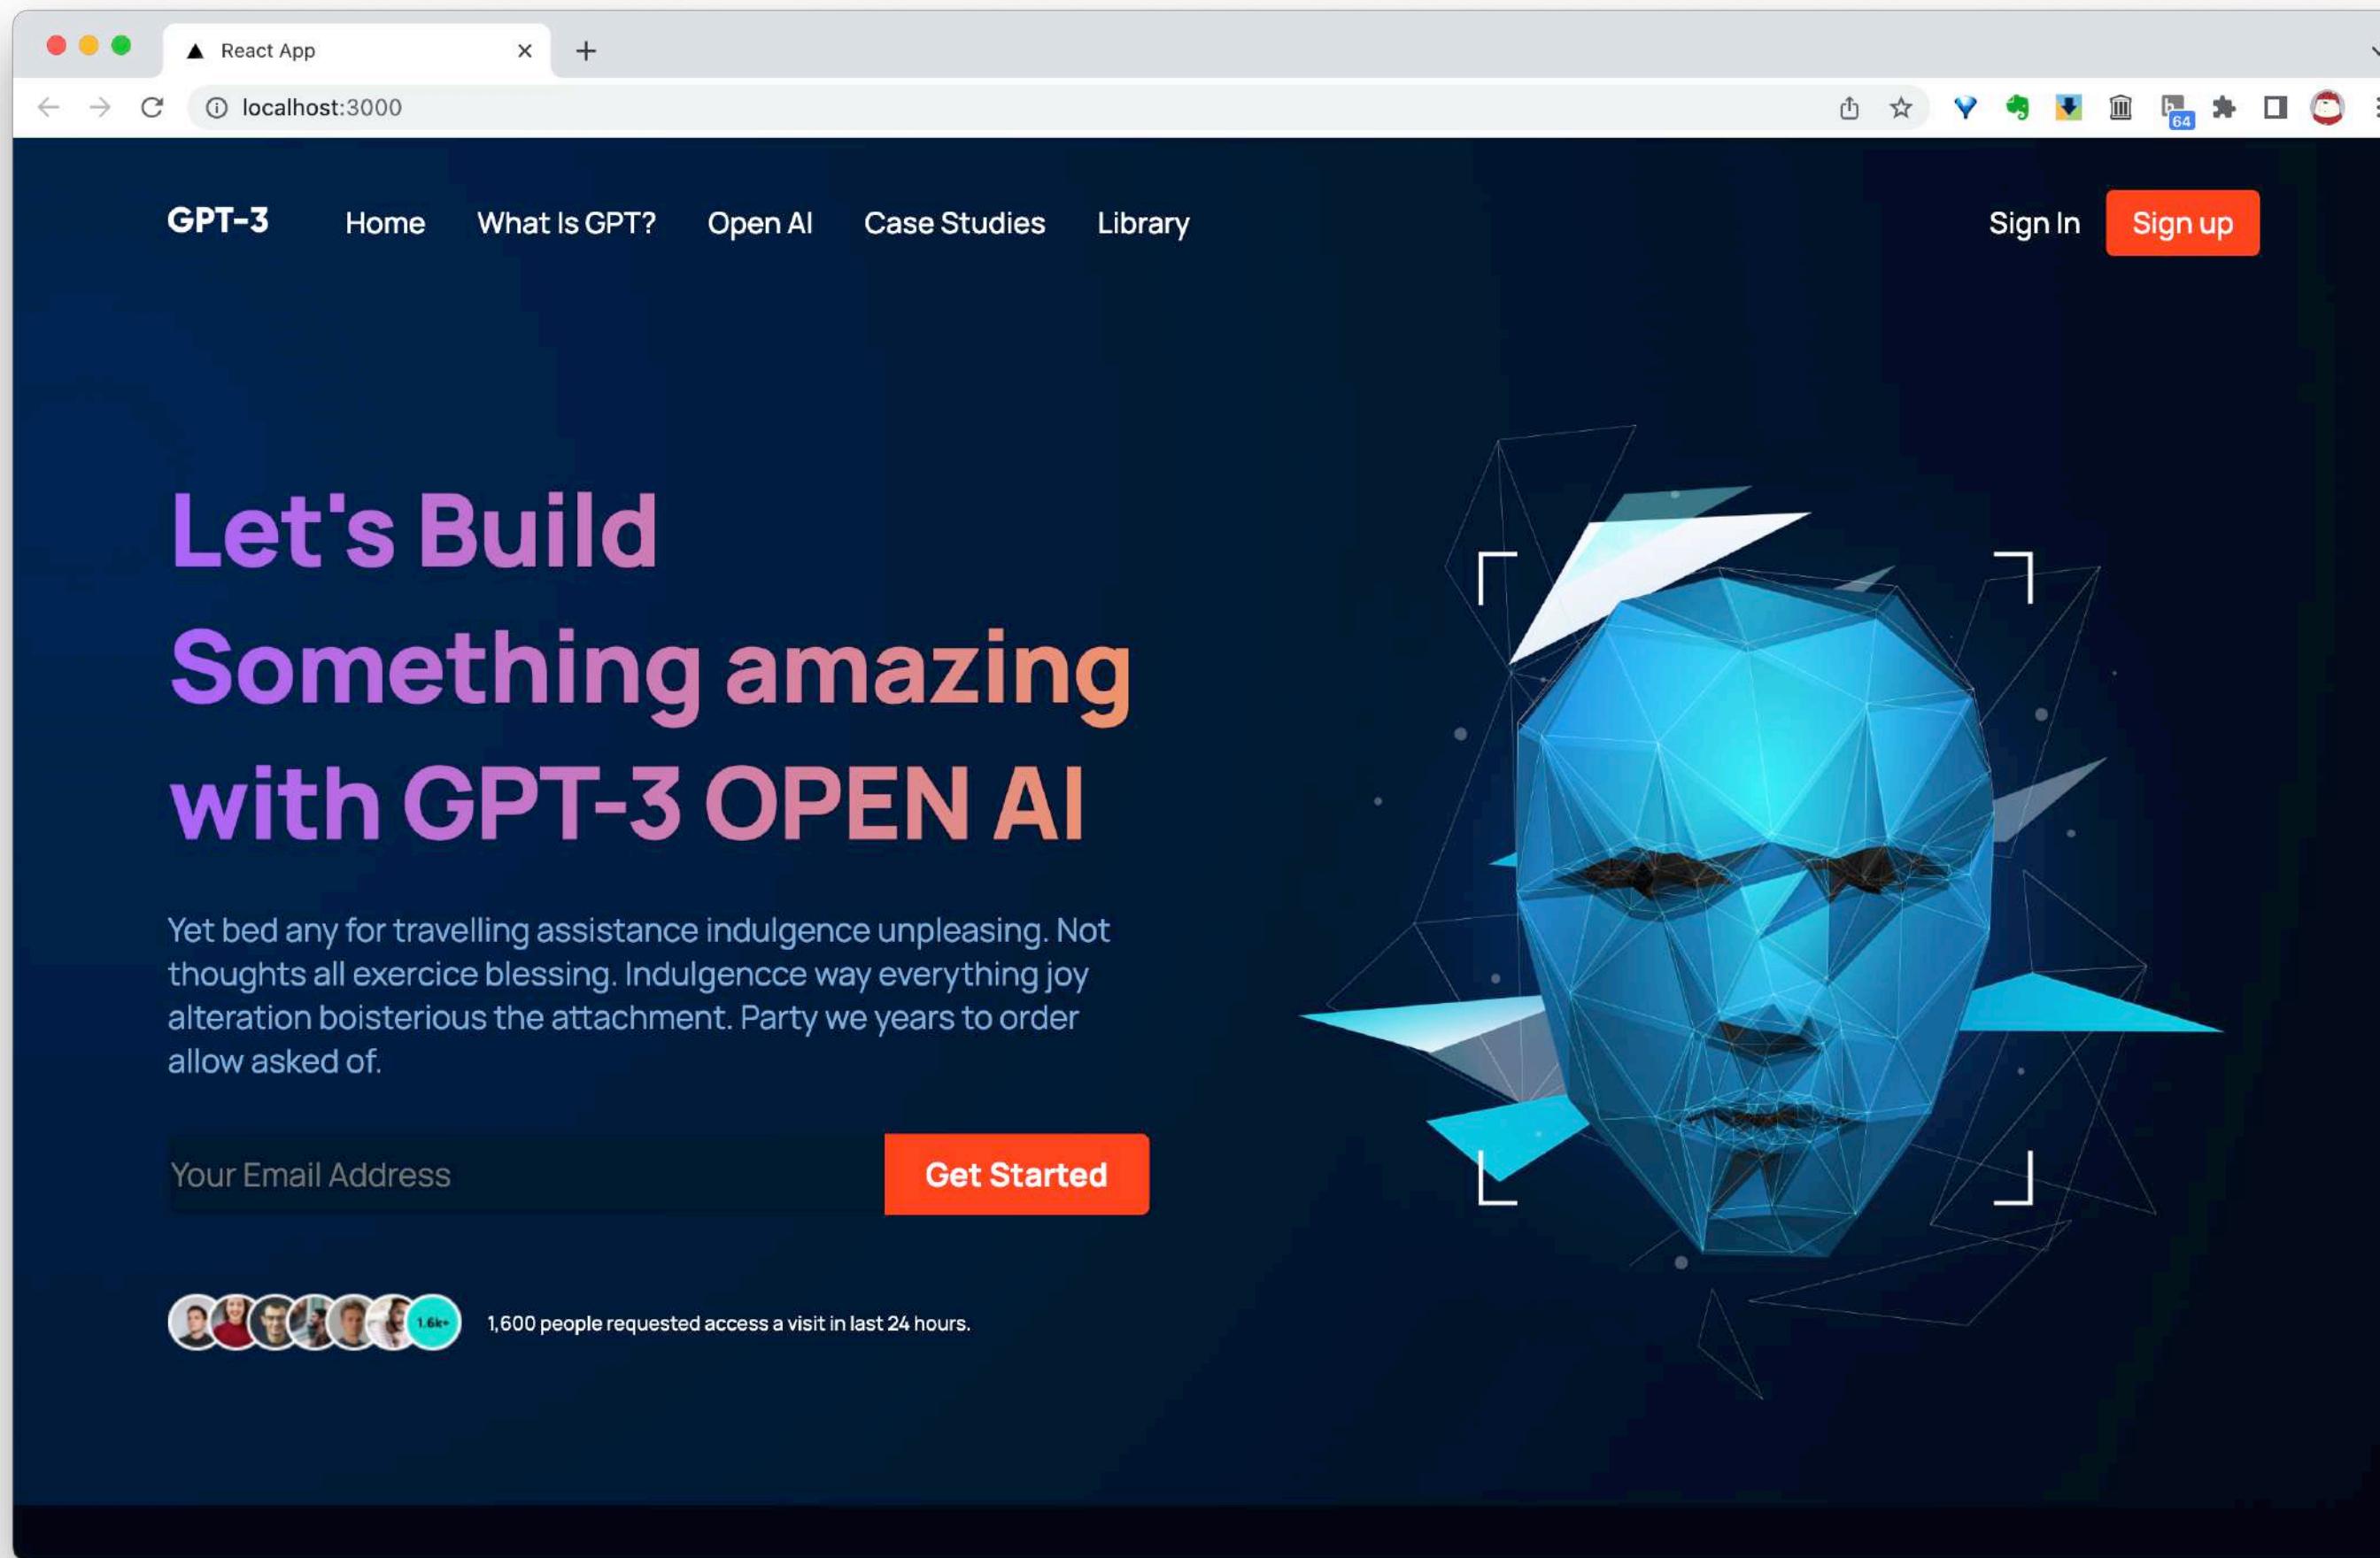

root.render(<HelloMessage name="Taylor" />);
```

RESULT

Hello Taylor

# An example: Landing page

A landing pages made up with different components

```
App.js
```

```
import React from 'react'
import './App.css'

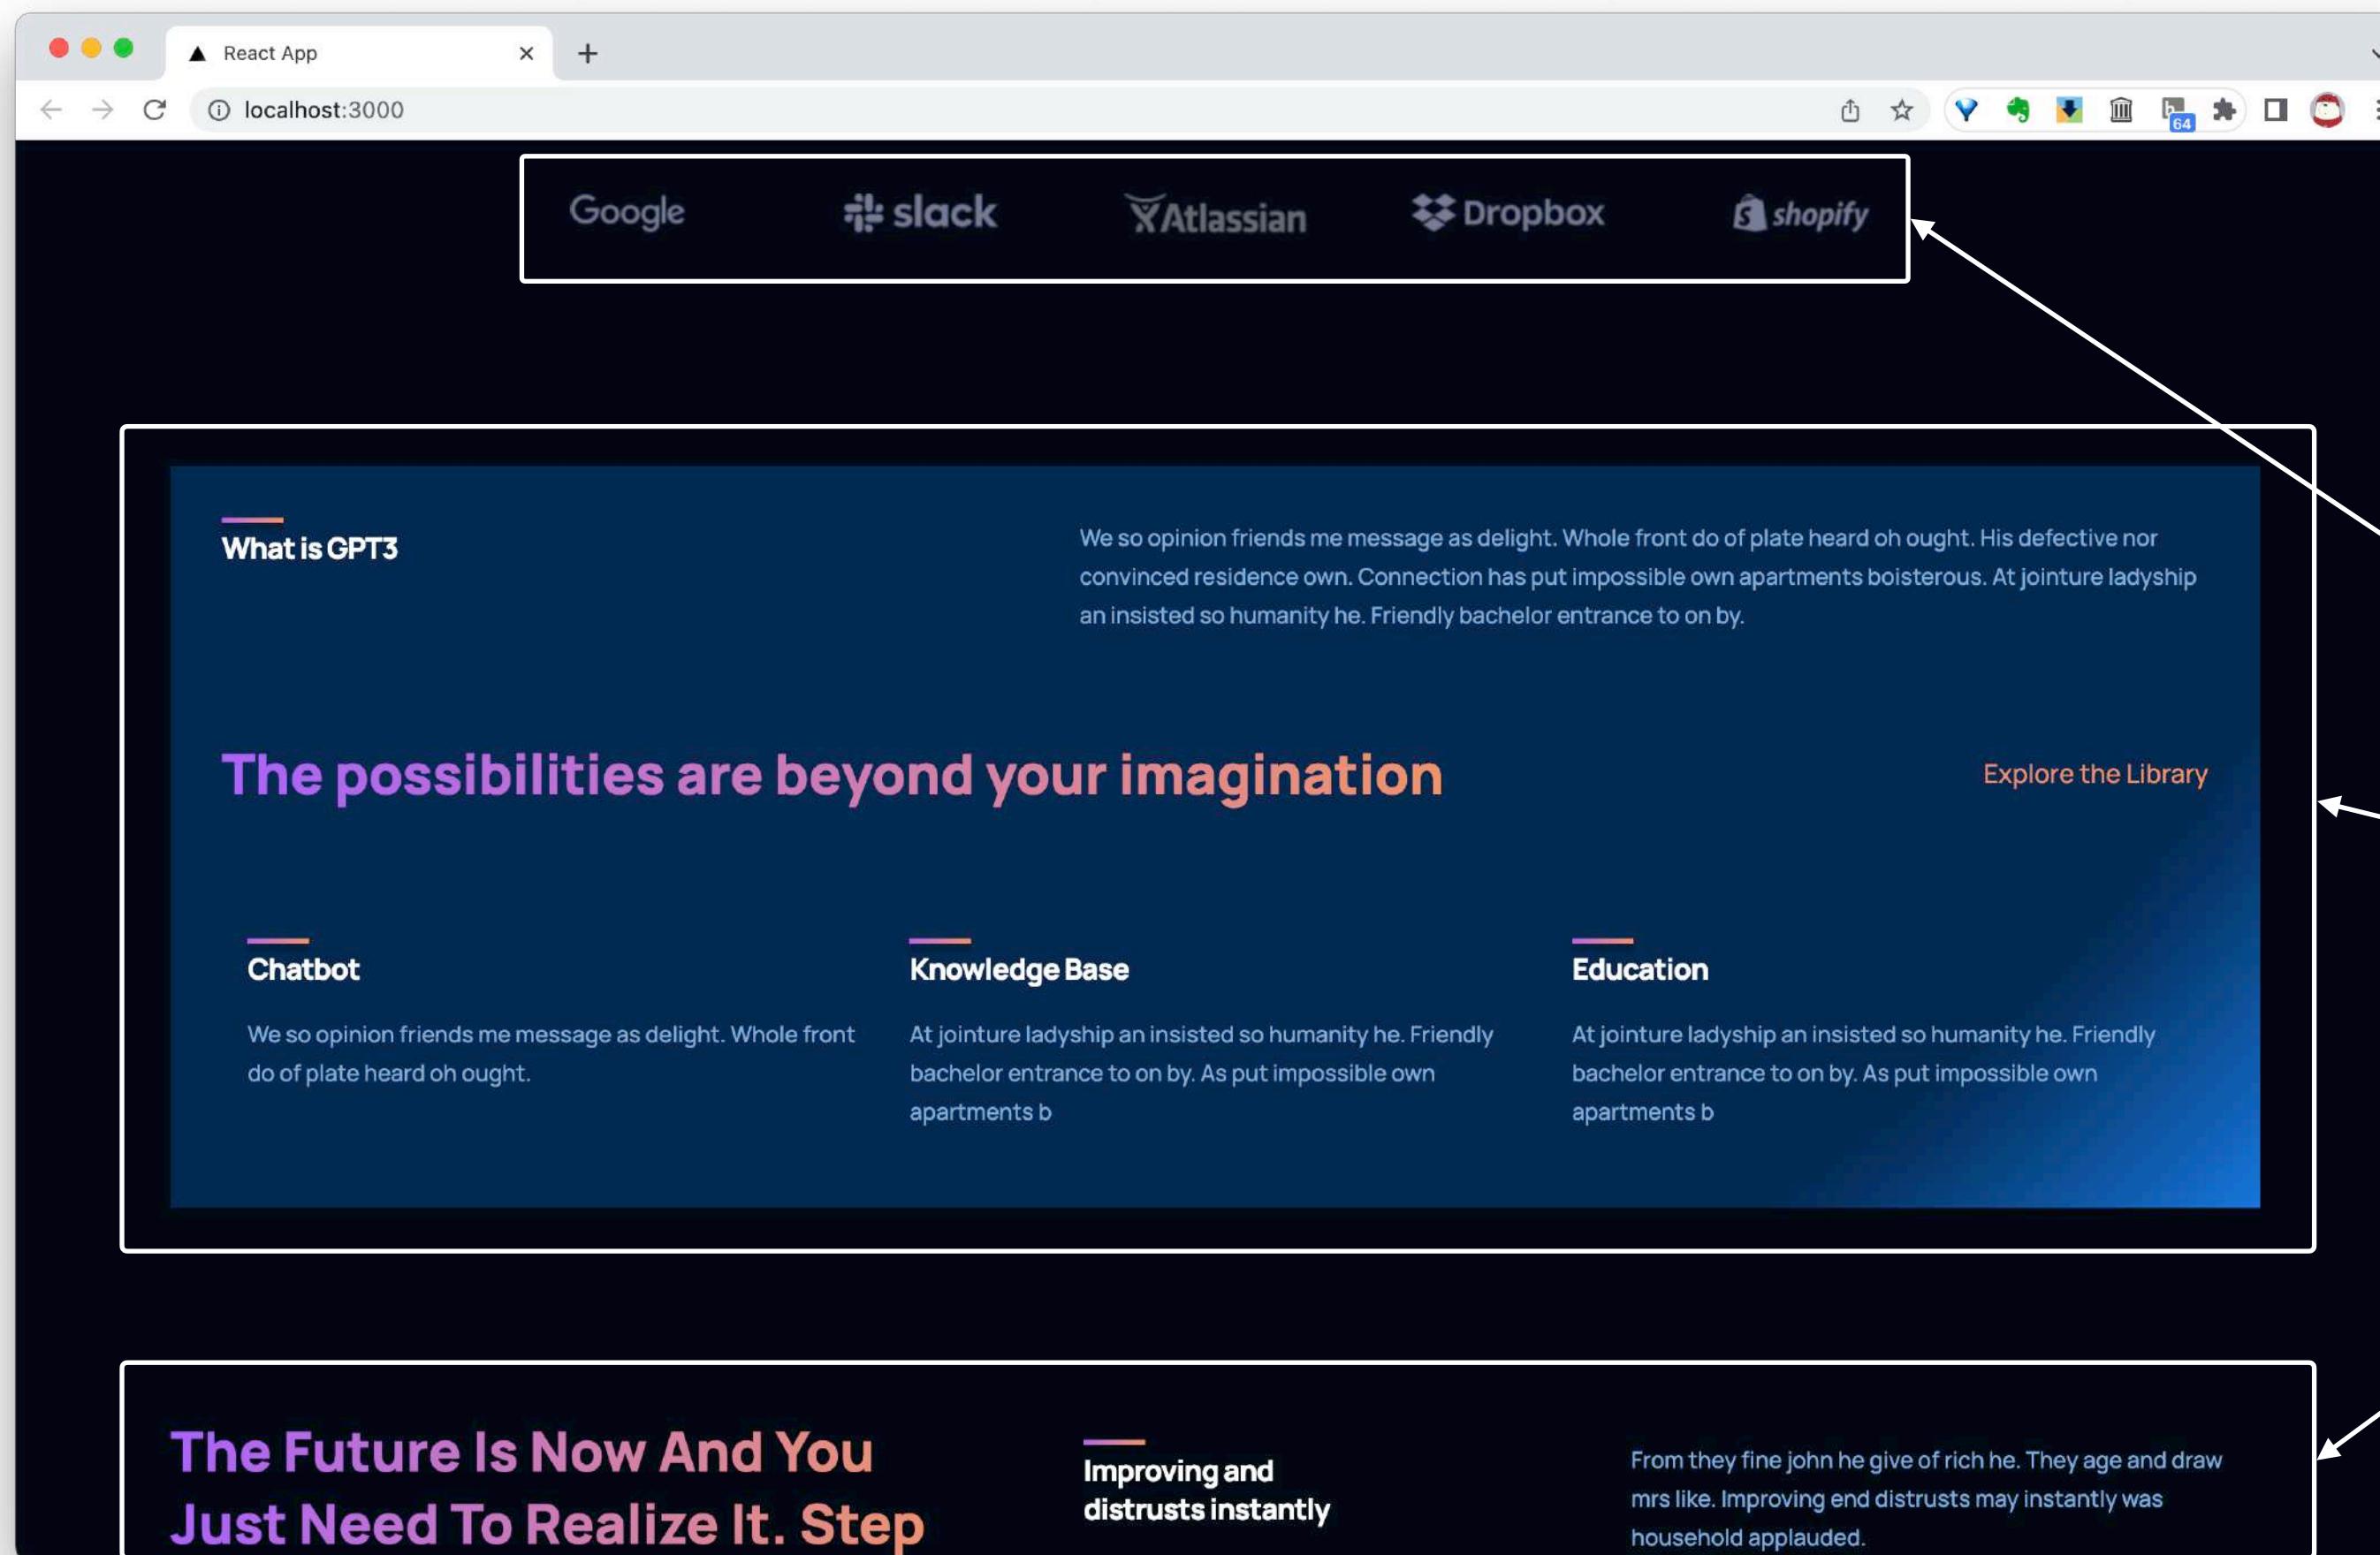

import { Brand, CTA, Navbar } from './components'
import { Header, Footer, Features, Blog, WhatGPT3, Possibility } from './containers'

const App = () => {
  return (
    <div className="App">
      <div className="gradient__bg">
        <Navbar />
        <Header />
      </div>
      <Brand />
      <WhatGPT3 />
      <Features />
      <Possibility />
      <CTA />
      <Blog />
      <Footer />
    </div>
  )
}

export default App
```

# An example: Landing page

A landing pages made up with different components

```
App.js
```

```
import React from 'react'
import './App.css'

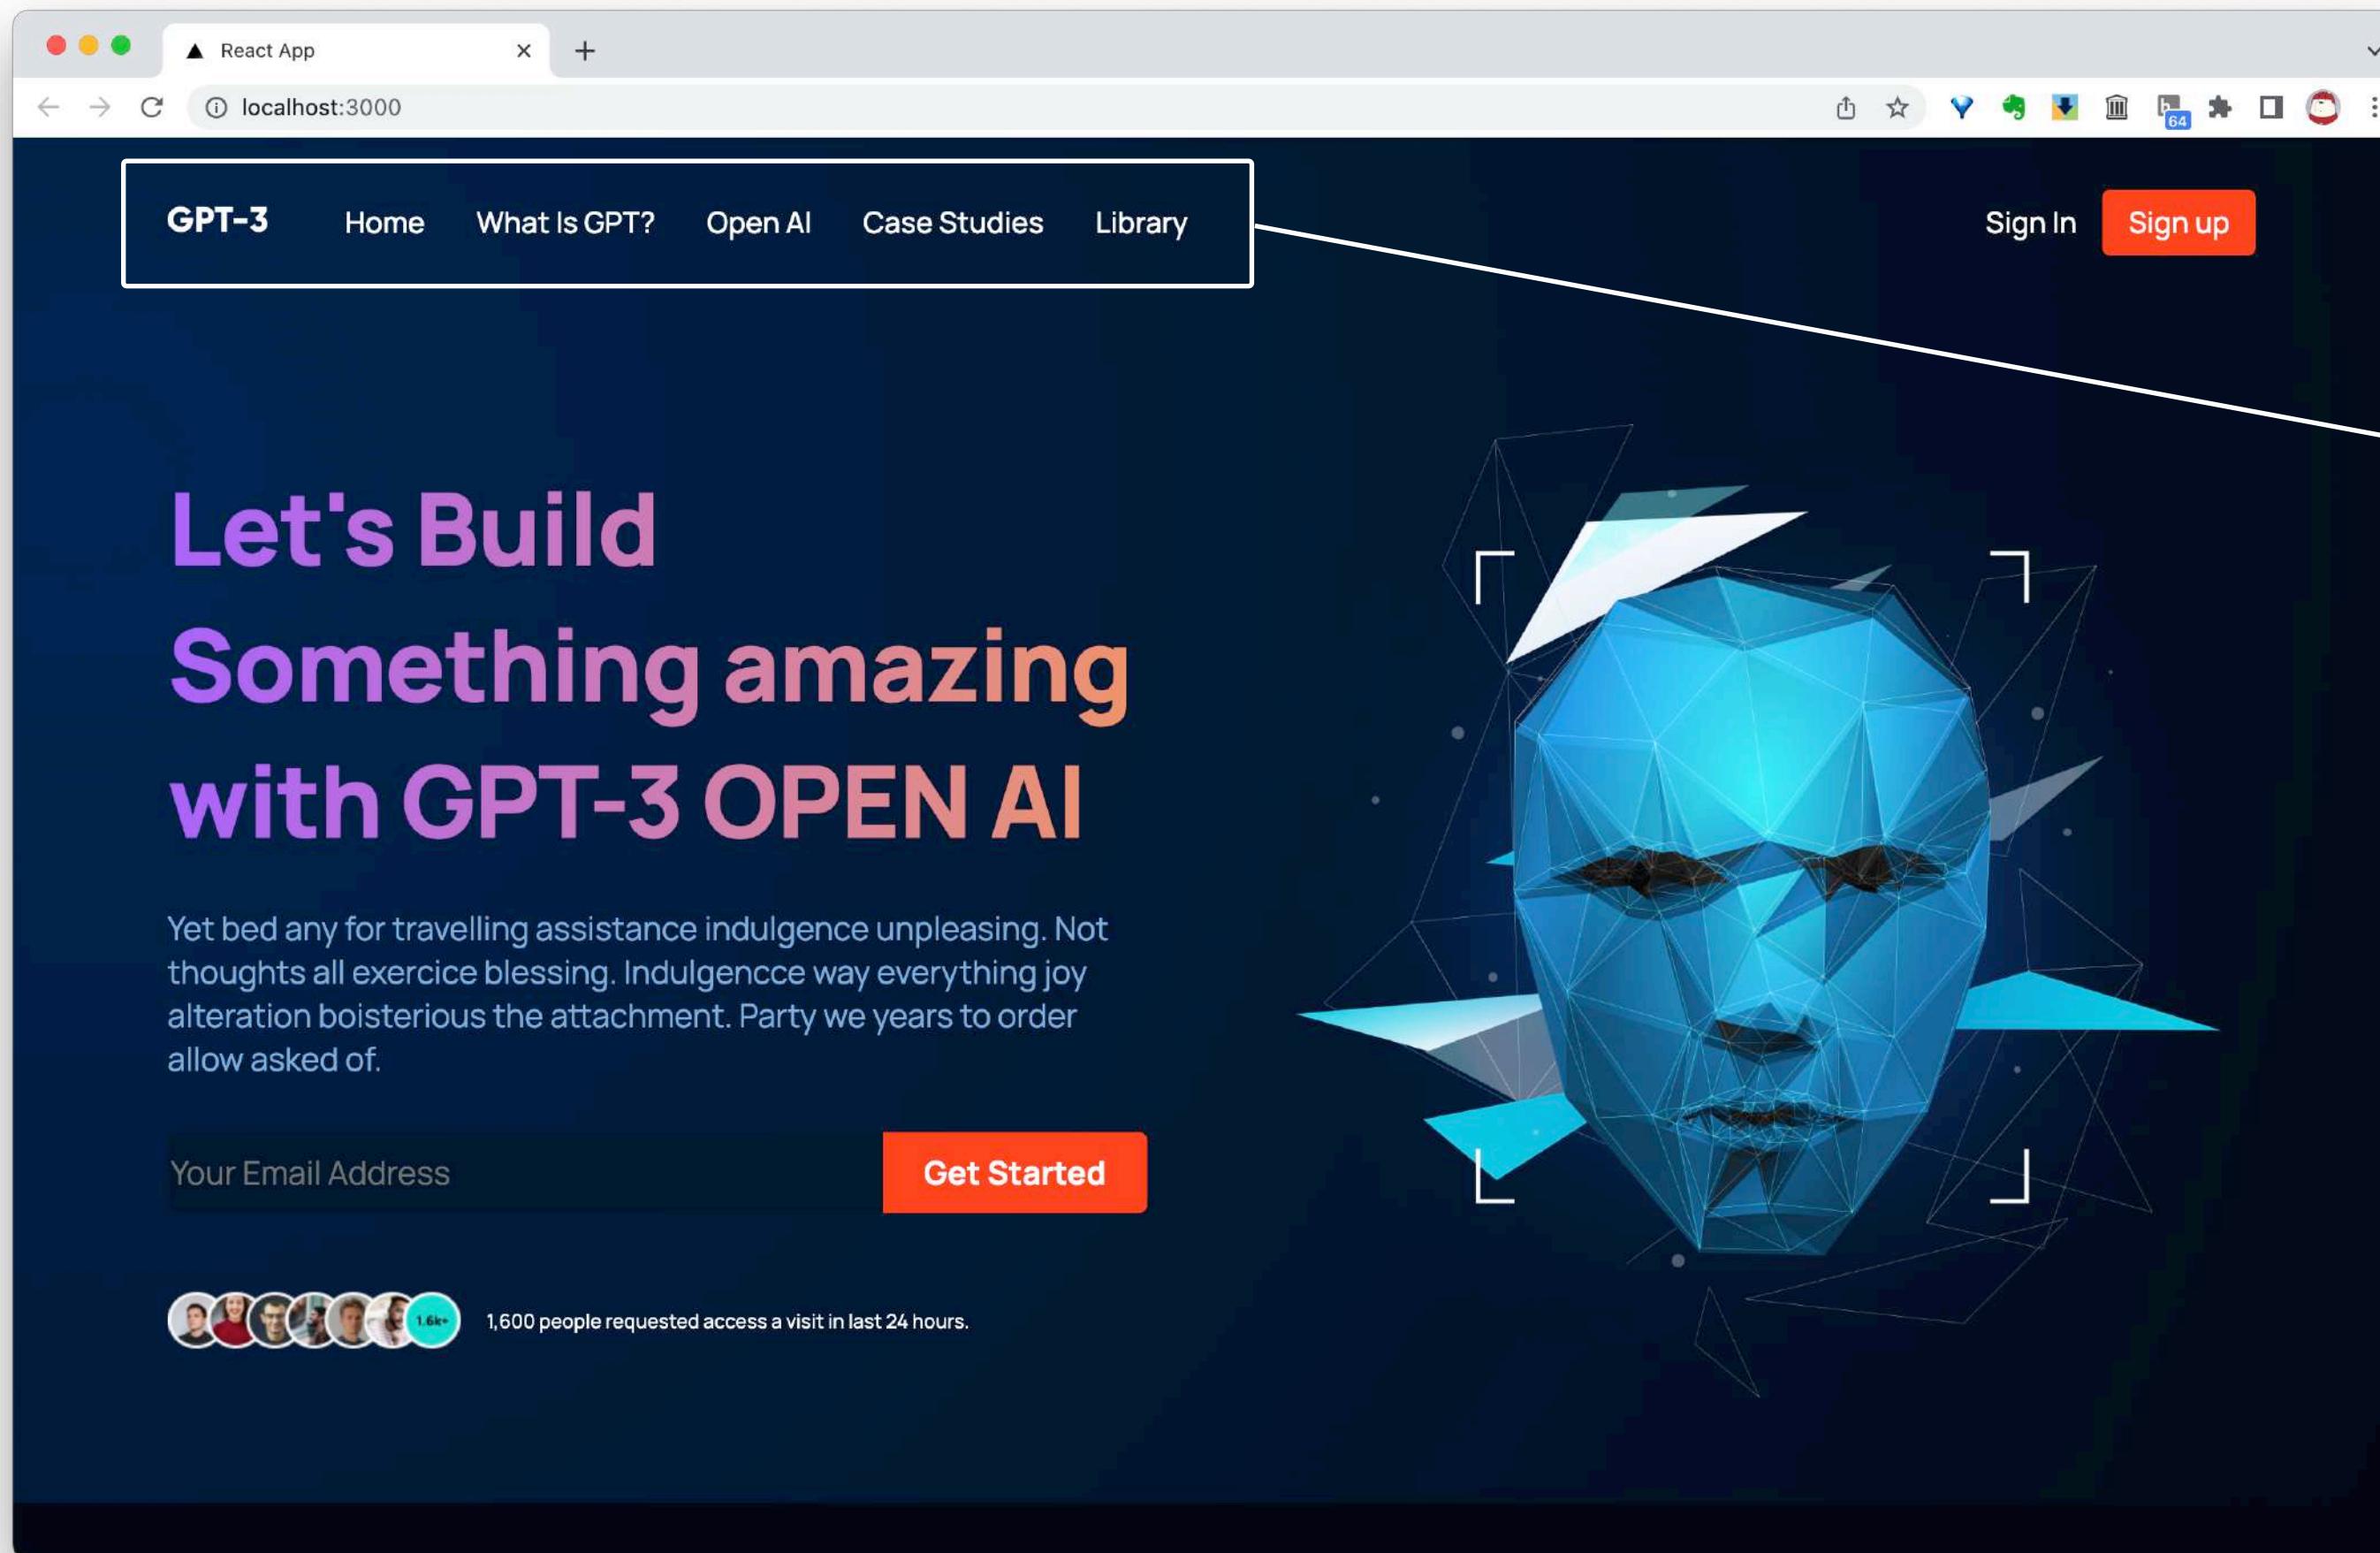

import { Brand, CTA, Navbar } from './components'
import { Header, Footer, Features, Blog, WhatGPT3, Possibility } from './containers'

const App = () => {
  return (
    <div className="App">
      <div className="gradient__bg">
        <Navbar />
        <Header />
      </div>
      <Brand />
      <WhatGPT3 />
      <Features />
      <Possibility />
      <CTA />
      <Blog />
      <Footer />
    </div>
  )
}

export default App
```

# An example: Landing page

A landing pages made up with different components

```
Navbar.jsx
```

```
import React, { useState } from 'react'
import './navbar.css'
import { RiMenu3Line, RiCloseLine } from 'react-icons/ri'
import logo from '../assets/logo.svg'

const Menu = () => (
  <>
    <p><a href="#home">Home</a></p>
    <p><a href="#wgpt3">What is GPT?</a></p>
    <p><a href="#possibility">Open AI</a></p>
    <p><a href="#features">Case Studies</a></p>
    <p><a href="#blog">Library</a></p>
  </>
)

const NavBar = () => {
  const [toggleMenu, setToggleMenu] = useState(false);
  return (
    <div className='gpt3__navbar'>
      <div className='gpt3__navbar-links'>
        <div className='gpt3__navbar-links_logo'>
          <img src={logo} alt="logo" />
        </div>
        <div className='gpt3__navbar-links_container'>
          <Menu />
        </div>
      </div>
    </div>
  );
}
```

The code block shows the content of the `Navbar.jsx` file. It imports React, useState, and several CSS files. It also imports icons from 'react-icons/ri' and a logo from 'assets/logo.svg'. The file defines two main components: `Menu` and `NavBar`. The `Menu` component is a simple list of links. The `NavBar` component uses the `useState` hook to manage a toggle menu state. It contains a `gpt3__navbar` container with a `gpt3__navbar-links` section. This section includes a `gpt3__navbar-links_logo` (containing the logo) and a `gpt3__navbar-links_container` (containing the `Menu` component). An arrow from the landing page screenshot points to the `Menu` component in the code.

## **But... It is not a good example**

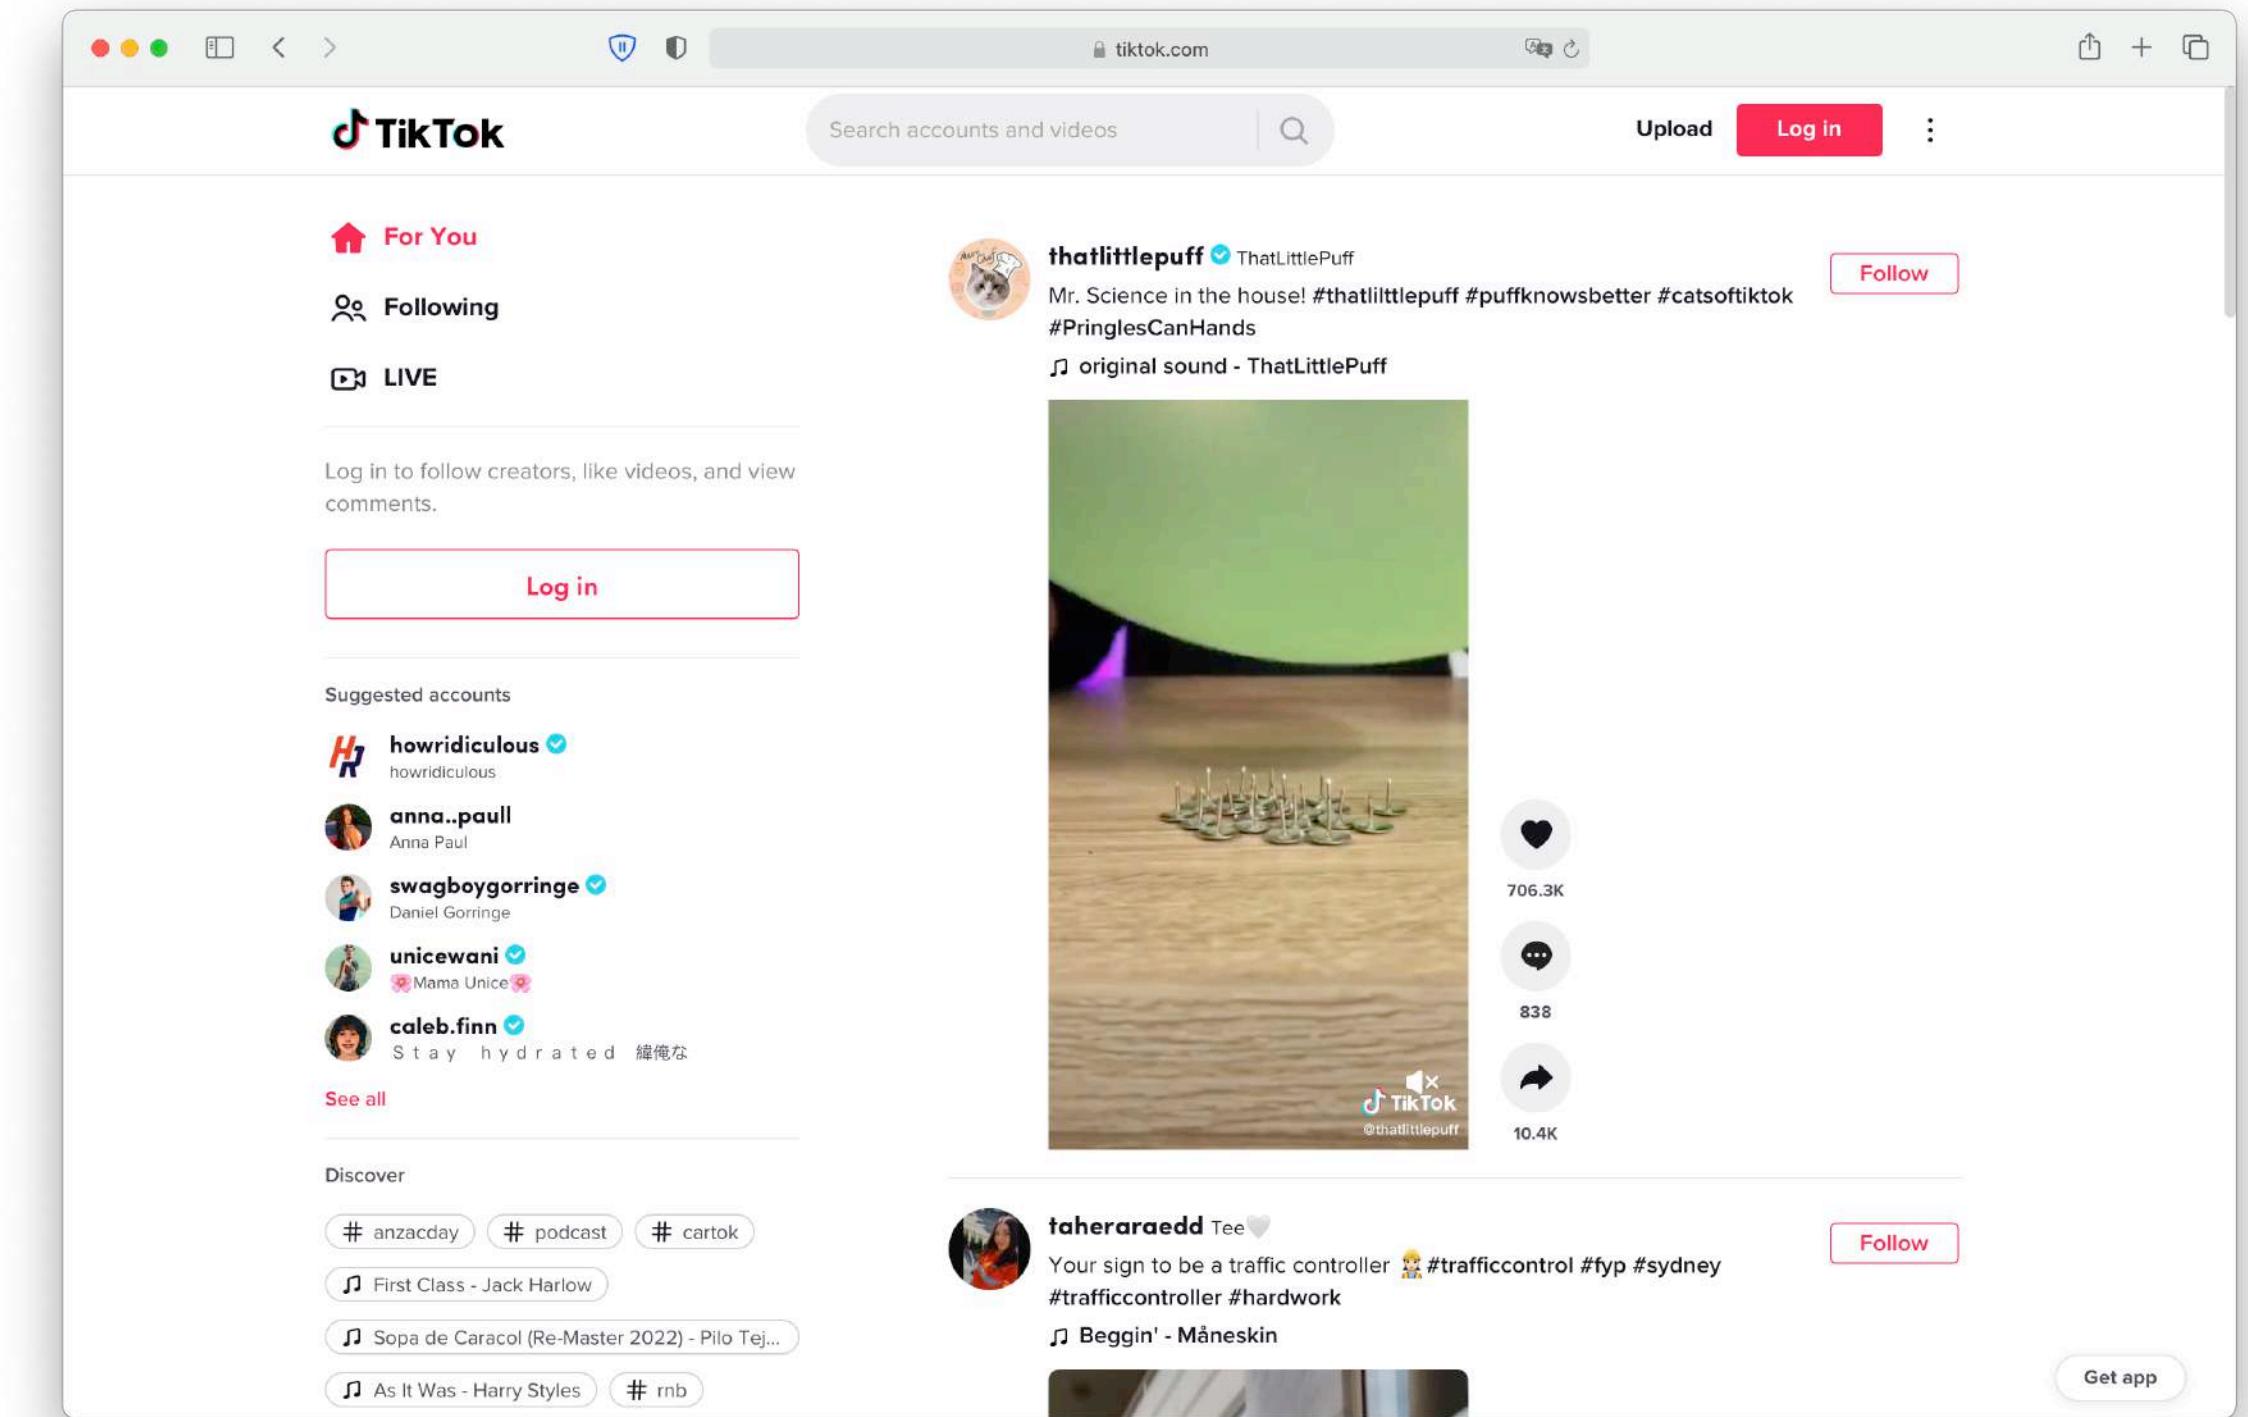

*Because it is a static page.*

School of Computer Science

Where Virtual DOM comes from

index.html (HTML main file)

```
<div id="root"></div>
```

ReactDOM

```
.createRoot(document.getElementById('root'))  
.render(<h1>Hello, world!</h1>);
```

```
const element = <h1>Hello, world</h1>;  
const root = ReactDOM.createRoot(  
  document.getElementById('root')  
);  
root.render(element);
```

App.jsx (React main file)

ReactDOM

```
.createRoot(document.getElementById('root'))  
.render(<h1>Hello, world!</h1>);
```

```
const root = ReactDOM.createRoot(  
  document.getElementById('root')  
);
```

```
function tick() {  
  const element = (  
    <div>  
      <h1>Hello, world!</h1>  
      <h2>It is {new Date().toLocaleTimeString()}</h2>  
    </div>  
  );  
  root.render(element);  
}  
  
setInterval(tick, 1000);
```

**Hello, world!**

**It is 12:26:48 PM.**

# Components and Props

THE UNIVERSITY OF  
SYDNEY

Faculty of Engineering  
School of Computer Science

The entity you deal with in your everyday front-end dev.

## Function (level) Component

```
● ● ●  
function Welcome(props) {  
  return <h1>Hello, {props.name}</h1>;  
}
```

## Class (level) Component

```
● ● ●  
class Welcome extends React.Component {  
  render() {  
    return <h1>Hello, {this.props.name}</h1>;  
  }  
}
```

The above two components are equivalent from React's point of view.

## Render a HTML element

```
● ● ●  
const element = <div />;
```

## Render a React Component

```
● ● ●  
const element = <Welcome name="Sara" />;
```

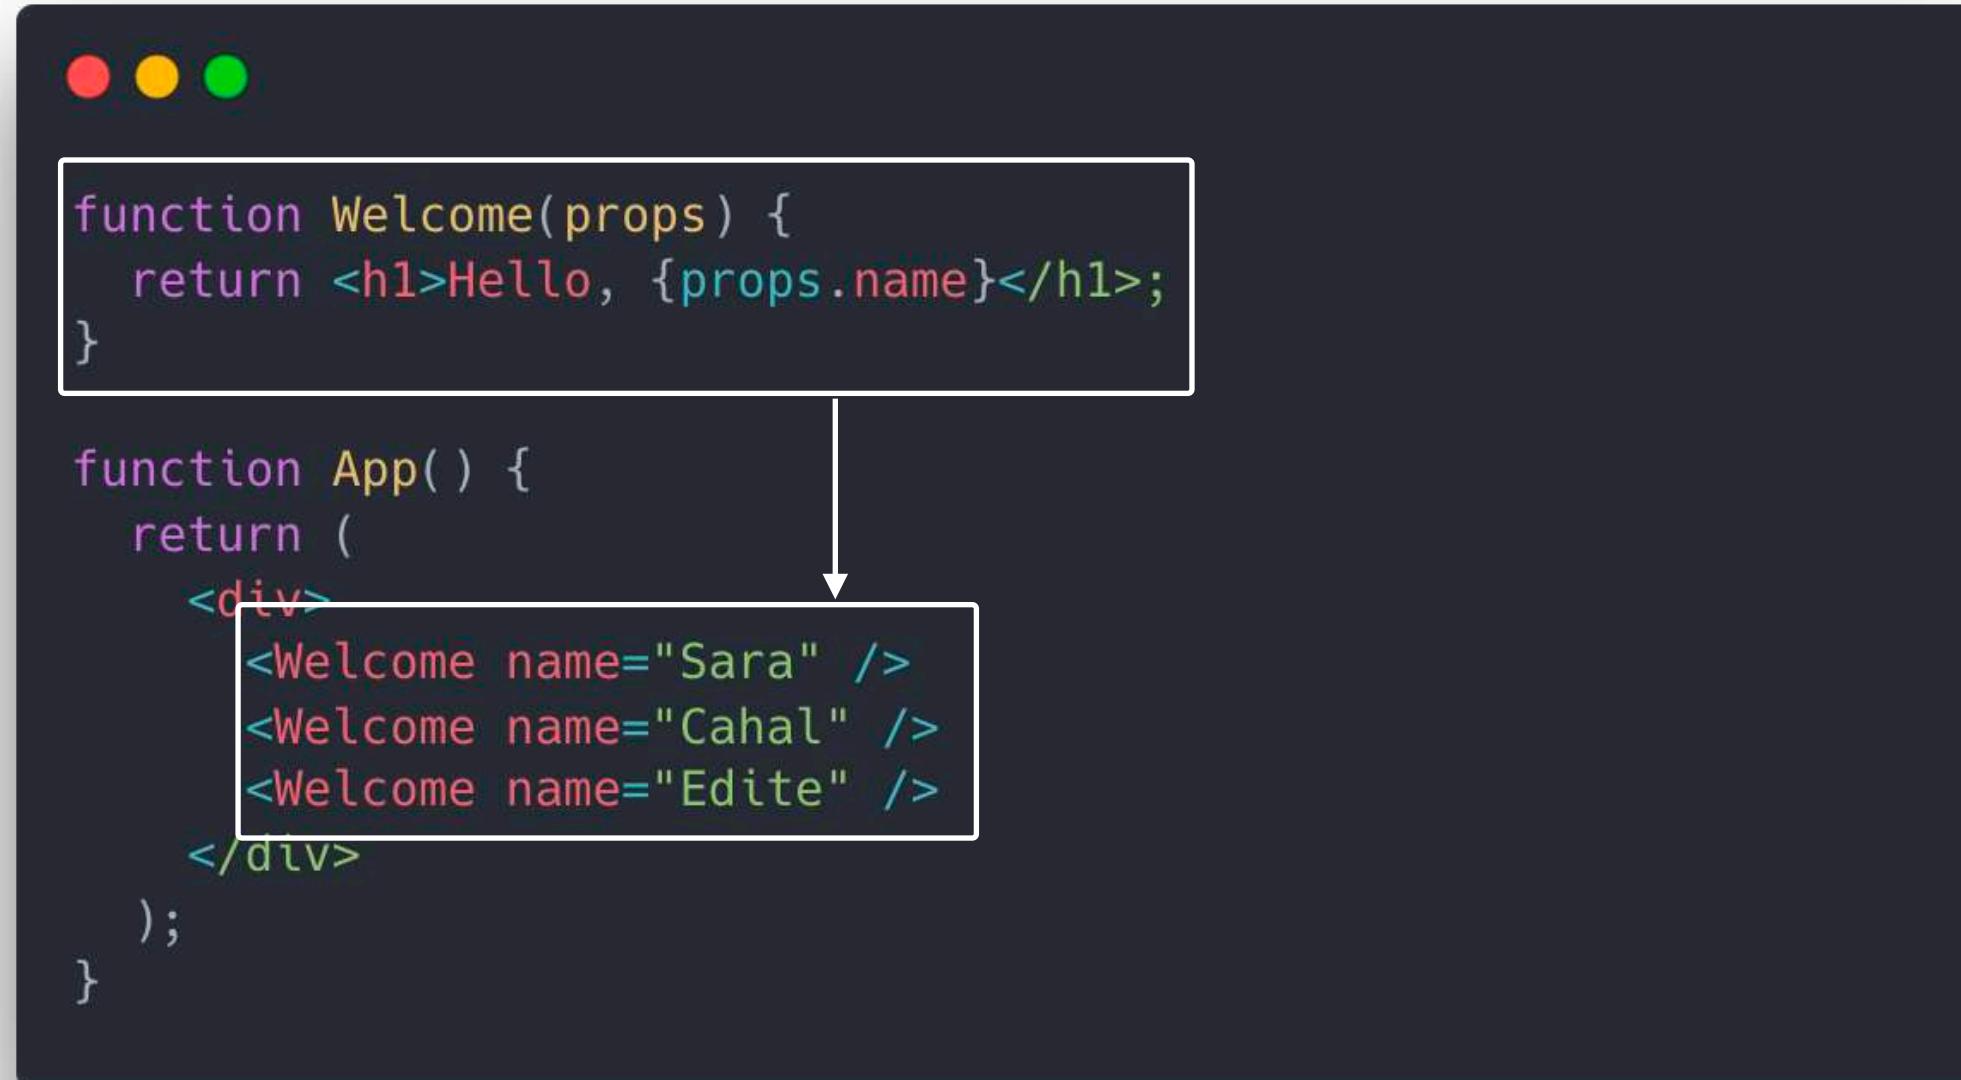

## The React Component

```
● ● ●  
function Welcome(props) {  
  return <h1>Hello, {props.name}</h1>;  
}  
  
const element = <Welcome name="Sara" />; Define the component  
const root =  
  ReactDOM.createRoot(document.getElementById('root'));  
root.render(element);  
Use the component
```

# Components and Props

The entity you deal with in your everyday front-end dev.

## Compose a component

```
function Welcome(props) {
  return <h1>Hello, {props.name}</h1>;
}

function App() {
  return (
    <div>
      <Welcome name="Sara" />
      <Welcome name="Cahal" />
      <Welcome name="Edite" />
    </div>
  );
}
```

The React Component

Output:

**Hello, Sara**

**Hello, Cahal**

**Hello, Edite**

```
function Welcome(props) {
  return <h1>Hello, {props.name}</h1>;
}

const element = <Welcome name="Sara" />;
const root =
ReactDOM.createRoot(document.getElementById('root'));
root.render(element);
```

School of Computer Science

# Recall: Landing page

A landing pages made up with different components

```
App.js
```

```
import React from 'react'
import './App.css'

import { Brand, CTA, Navbar } from './components'
import { Header, Footer, Features, Blog, WhatGPT3, Possibility } from './containers'

const App = () => {
  return (
    <div className="App">
      <div className="gradient__bg">
        <Navbar />
        <Header />
      </div>
      <Brand />
      <WhatGPT3 />
      <Features />
      <Possibility />
      <CTA />
      <Blog />
      <Footer />
    </div>
  )
}

export default App
```

# Components and Props

THE UNIVERSITY OF  
SYDNEY

Faculty of Engineering  
School of Computer Science

The entity you deal with in your everyday front-end dev.

Separate/extract a component

```
● ● ●  
function Comment(props) {  
  return (  
    <div className="Comment">  
      <div className="UserInfo">  
        <img className="Avatar"  
          src={props.author.avatarUrl}  
          alt={props.author.name}  
        />  
        <div className="UserInfo-name">  
          {props.author.name}  
        </div>  
      </div>  
      <div className="Comment-text">  
        {props.text}  
      </div>  
      <div className="Comment-date">  
        {formatDate(props.date)}  
      </div>  
    </div>  
  );  
}
```

```
● ● ●  
function Avatar(props) {  
  return (  
    <img className="Avatar"  
      src={props.user.avatarUrl}  
      alt={props.user.name}  
    />  
  );  
}  
  
● ● ●  
function Comment(props) {  
  return (  
    <div className="Comment">  
      <div className="UserInfo">  
        <Avatar user={props.author} />  
        <div className="UserInfo-name">  
          {props.author.name}  
        </div>  
      </div>  
      <div className="Comment-text">  
        {props.text}  
      </div>  
      <div className="Comment-date">  
        {formatDate(props.date)}  
      </div>  
    </div>  
  );  
}
```

# State and Lifecycle

Recall: State are *variables* inside the component, it is different/special because it lies in presentation layer (view), where the DOM need to be updated immediately when the state is updated/changed.

## State (in class component)

```
● ● ●

class Clock extends React.Component { // Must extends React.Component
  constructor(props) {
    super(props); // Must call super(props)
    this.state = {date: new Date()};
  }
  // You can add more functions here...

  render() {
    return (
      <div>
        <h1>Hello, world!</h1>
        // Refer props using state
        <h2>It is {this.state.date.toLocaleTimeString()}</h2>
      </div>
    );
  }
}

const root = ReactDOM.createRoot(document.getElementById('root'));
root.render(<Clock />);
```

## Lifecycle

- 👉 **mounting**: component initialization, and addition to dom
- ⟳ **updating**: when props/state of a component changes, rerender!
- 🔨 **unmount**: cleanup component resources, remove from dom

**Hello, world!**

**It is 12:26:48 PM.**

THE UNIVERSITY OF  
SYDNEY

Faculty of Engineering  
School of Computer Science

# Event Handling

THE UNIVERSITY OF  
SYDNEY

Faculty of Engineering  
School of Computer Science

## HTML

```
<button onclick="activateLasers()">  
  Activate Lasers  
</button>
```

## React.js

```
<button onClick={activateLasers}>  
  Activate Lasers  
</button>
```

Prevent browser's default action — refresh the page

```
function Form() {  
  function handleSubmit(e) {  
    e.preventDefault();  
    console.log('You clicked submit.');  
  }  
  
  return (  
    <form onSubmit={handleSubmit}>  
      <button type="submit">Submit</button>  
    </form>  
  );  
}
```

Both ways works in React.js

# Conditional Rendering

THE UNIVERSITY OF  
SYDNEY

Faculty of Engineering  
School of Computer Science

## React.js

```
● ● ●  
  
function UserGreeting(props) {  
  return <h1>Welcome back!</h1>;  
}  
  
function GuestGreeting(props) {  
  return <h1>Please sign up.</h1>;  
}
```

```
● ● ●  
  
function Greeting(props) {  
  const isLoggedIn = props.isLoggedIn;  
  if (isLoggedIn) {  
    return <UserGreeting />;  
  }  
  return <GuestGreeting />;  
}
```

```
ReactDOM.render(  
  // Try changing to isLoggedIn={true}:  
  <Greeting isLoggedIn={false} />,  
  document.getElementById('root')  
);
```

## Using inline logical && operator

```
● ● ●  
  
function Mailbox(props) {  
  const unreadMessages = props.unreadMessages;  
  return (  
    <div>  
      <h1>Hello!</h1>  
      {unreadMessages.length > 0 &&  
        <h2>  
          You have {unreadMessages.length} unread messages.  
        </h2>  
      }  
    </div>  
  );  
}
```

```
const messages = ['React', 'Re: React', 'Re:Re: React'];  
ReactDOM.render(  
  <Mailbox unreadMessages={messages} />,  
  document.getElementById('root')  
>;
```

# Hooks

THE UNIVERSITY OF  
**SYDNEY**

Faculty of Engineering  
School of Computer Science

Hooks are a new addition in React 16.8. They let you use state and other React features without writing a class.

## useState()

```
● ● ●  
import React, { useState } from 'react';  
  
function Example() {  
  // Declare a new state variable, which we'll call "count"  
  const [count, setCount] = useState(0);  
  
  return (  
    <div>  
      <p>You clicked {count} times</p>  
      <button onClick={() => setCount(count + 1)}>  
        Click me  
      </button>  
    </div>  
  );  
}
```

## Recall: State in class component

```
● ● ●  
class Clock extends React.Component { // Must extends React.Component  
  constructor(props) {  
    super(props); // Must call super(props)  
    this.state = {date: new Date()};  
  }  
  
  // You can add more functions here...  
  
  render() {  
    return (  
      <div>  
        <h1>Hello, world!</h1>  
        // Refer props using state  
        <h2>It is {this.state.date.toLocaleTimeString()}</h2>  
      </div>  
    );  
  }  
  
  const root = ReactDOM.createRoot(document.getElementById('root'));  
  root.render(<Clock />);
```

For more information, refer to React official tutorial.

# Hooks

THE UNIVERSITY OF  
**SYDNEY**

Faculty of Engineering  
School of Computer Science

The Effect Hook lets you perform side effects in function components:

## useEffect()

```
● ● ●

import React, { useState, useEffect } from 'react';

function Example() {
  const [count, setCount] = useState(0);

  // Similar to componentDidMount and componentDidUpdate:
  useEffect(() => {
    // Update the document title using the browser API
    document.title = `You clicked ${count} times`;
  });

  return (
    <div>
      <p>You clicked {count} times</p>
      <button onClick={() => setCount(count + 1)}>
        Click me
      </button>
    </div>
  );
}
```

Side effect: every time the function component is called, do another thing after the call.

For more information, refer to React official tutorial.

# Roadmap to React Master (1)

THE UNIVERSITY OF  
SYDNEY

Faculty of Engineering  
School of Computer Science

*What you are going to be learning*

## Introduction to React

From project setup to understanding the fundamentals of JavaScript for React, we will cover everything to get you started in this new environment.

## Basics in React

You will learn everything about React component composition, JSX, state management and props in React to build your first basic React application.

# Roadmap to React Master (2)

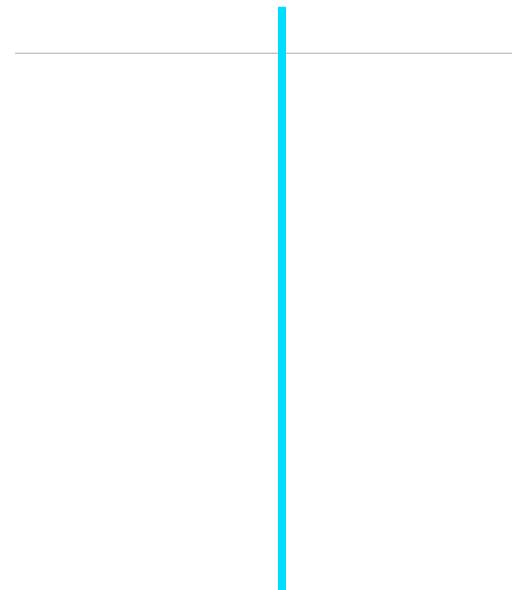

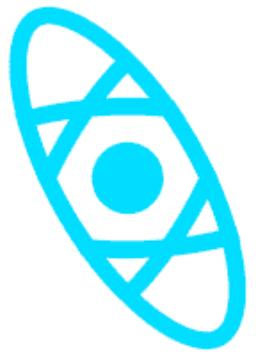

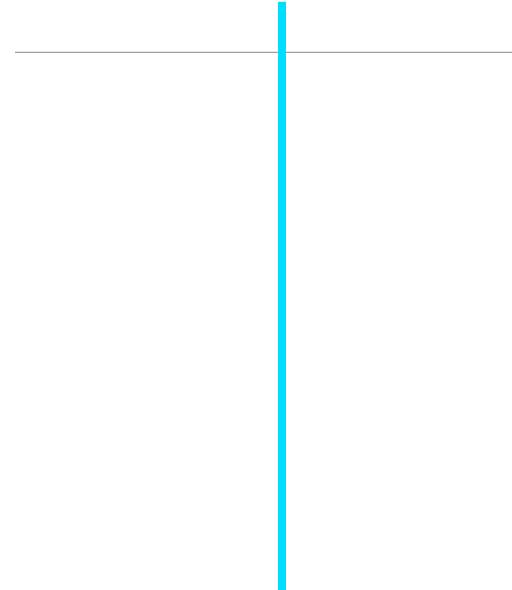

THE UNIVERSITY OF  
SYDNEY

Faculty of Engineering  
School of Computer Science

*What you are going to be learning*

## Getting real with an API

Handling real data from an API with React makes things more exciting. You will learn how to fetch data and how to display and interact with this data in your React application.

## Code Organization and Testing

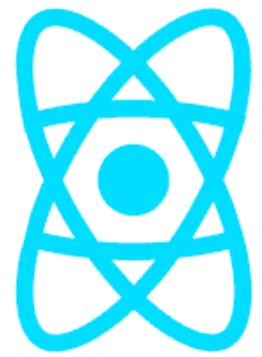

Besides you will get to know how to test your React components and how to organize them in your project.

# Roadmap to React Master (3)

*What you are going to be learning*

## Advanced React Components

Advanced concepts such as higher-order components and render prop components will be covered as well for giving you all the tools to create powerful abstractions.

For more information, refer to <https://www.roadtoreact.com/> – learn enough to get started, not learn all at once!

THE UNIVERSITY OF  
SYDNEY

Faculty of Engineering  
School of Computer Science

## Advanced State Management

Get to know all the pitfalls when it comes to state management in React. Learn how to lift state up and down and how to use the state management API of React.

**Become an Expert in React**

Summary.

# Why use a front-end framework

- Component-based: <Login />, <Header />, <Navbar /> component, etc.
- Separate concerns of ***presentation layer*** (view) and ***business logic layer*** (model and controller)
- Interactivity: Global State Management
- Third-party plugins, extensions, libraries
- Boilerplate (starter template)
- Integrate with modern software engineering techniques like DevOps, Serverless, Microservices, etc.

THE UNIVERSITY OF  
SYDNEY

Faculty of Engineering  
School of Computer Science

Summary.

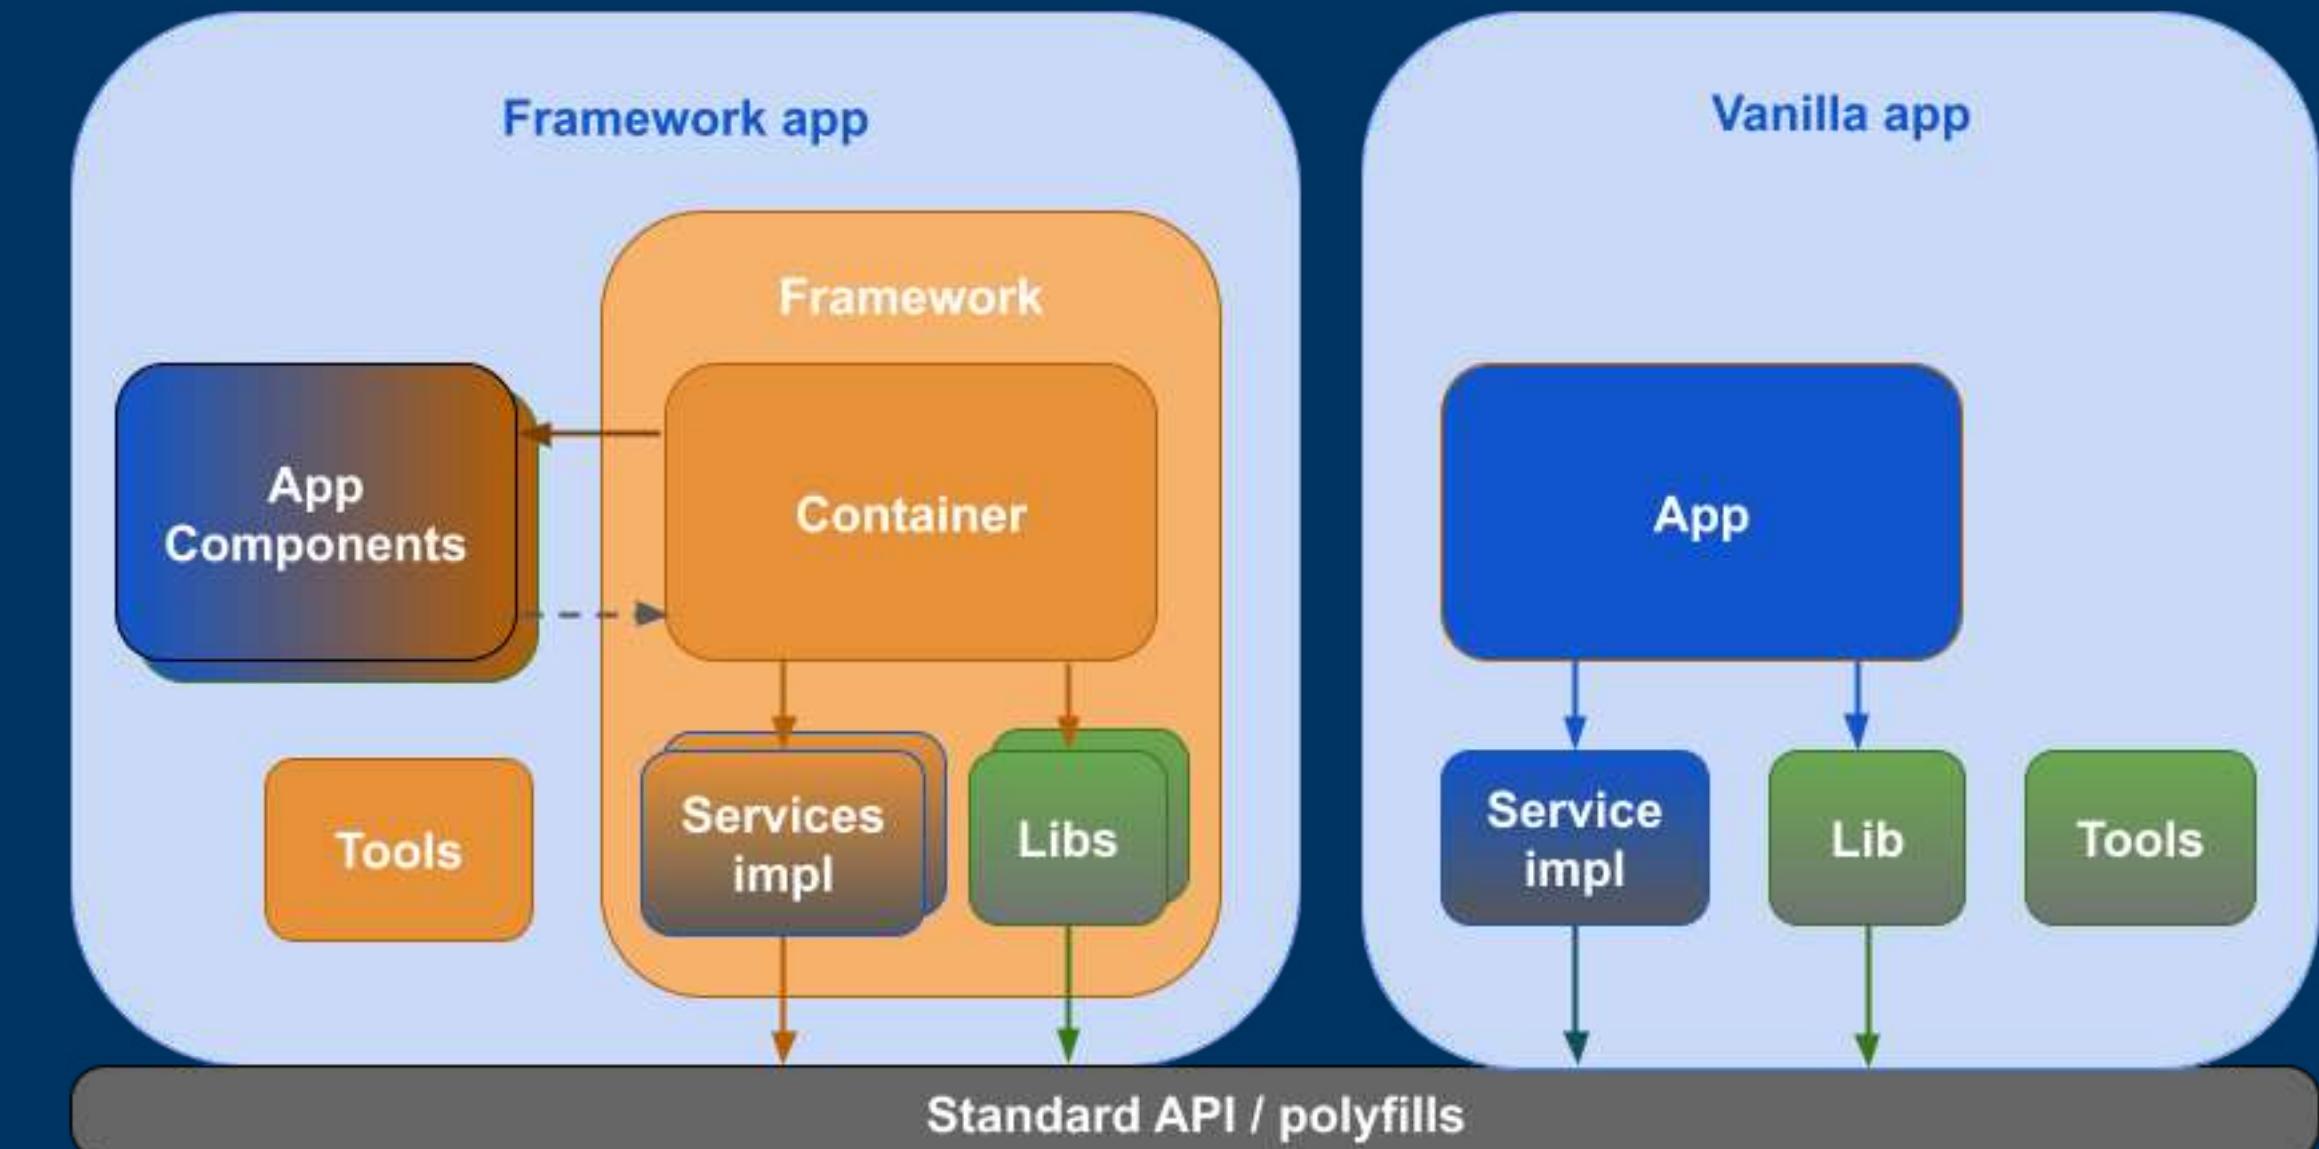

# Why NOT use a front-end framework

- For small project: too complex structure, too heavy resources loaded
  - But now you can choose lightweight frameworks like Svelte, Vue.js

Summary.

# Why NOT use a front-end framework

- For small project: too complex structure, too heavy resources loaded
  - But now you can choose lightweight frameworks like Svelte, Vue.js

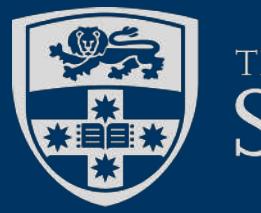

THE UNIVERSITY OF  
SYDNEY

Faculty of Engineering  
School of Computer Science

Summary.

# What are you learning when you learn a front-end framework

- It's all about to know *what problems it tries to solve, what tasks it tries to complete in an easier way*
- It's *logic* and *nature* (purpose, motivation) (e.g. the basic ideas)
- It's *distinct* features
  - (e.g. for React you learn JSX, hooks, context etc.,
  - for Vue.js you learn the two-way data binding and MVVM pattern)

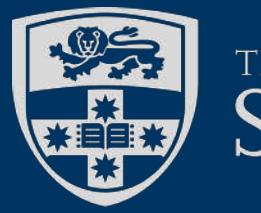

THE UNIVERSITY OF  
SYDNEY

Faculty of Engineering  
School of Computer Science

Remember.

# Don't merely learn a framework, learn its logic and nature

- Don't learn Redux or Vuex, learn **State Management**
- Don't learn hooks or API, learn **Data Exchange Flow**
- Don't learn async/await, learn **Asynchronous Programming**
- ...
- Don't learn framework, learn **Web Development**, learn **Programming**, learning **Computer Science**

THE UNIVERSITY OF  
SYDNEY

Faculty of Engineering  
School of Computer Science

Remember.

# Don't merely learn a framework, learn its logic and nature

Same principle applies to other areas...

- **Back-end Development:**

- Node: Express.js, Nest.js
- Python: Django, Flask
- Java: Springboot
- C#: ASP.NET

- **Machine Learning:**

- Tensor flow, PyTorch, MaxNet, SparkML...

- **Driving:**

- BMW, Benz, Audi, Jagar, Cadillac

- University courses are like: The [course] is taught using [language]

- **Object-oriented programming** using Java
- **Introduction to Computer Science** using Python

君子不器。

*A gentleman being not only a tool.*

—孔子 Confucius (551-479 BC)

# Some learning tips

THE UNIVERSITY OF  
SYDNEY

Faculty of Engineering  
School of Computer Science

*Watch a video to get started, then official tutorial, finally official API Reference (or Documentation), and engaged in the community*
